This 3rd amendment is raised to modify the Handle/Slabs description in Annex A:

Please include:

- Handle length will be 4.250 " + - 0.188" when measured along the straight edge on the bottom of the handle to it's termination at the top of the spine of the blade
-

Clarification:

Questions and answers:

1) Question: What diameter of nylon braid is required for the lanyard?

2) Answer: Our choice is black 550 cord

3) Question: There were no detailed dimensions for the overall knife length?.

4) Answer: OAL will be 08.250" + - .125" when measured along the straight line of the bottom of the handle from the pommel to the point of the blade

5) Question: The remaining question concerns blade finish. The response I received said "ground finish". This does not exist as a 'finish' description in the knife manufacturing process.

There seems to be some confusion at DND over terminology. In manufacturing a knife, the term "finish ground" or "final grind", is used to describe a machining operation that forms the knife to its final configuration. This does not describe a "surface finish".

6) Answer: We are referring to "grind/ground" as a surface finish on the blade and he is referring to "grind/ground" as a method of stock removal for the forming of the primary angle on the cutting edge.

A knife blade made using the stock removal process may in fact have a ground finish. The blade can be finished on a surface grinder (a machine tool that precision grinds) or a belt grinder for curved or irregular surfaces to insure the blade is free of tool marks and to provide a finish varying from very rough to almost chrome like, depending on the grit size and type used in the abrasive wheel or belt.

Many, but not all knives are polished afterward to provide a bright shiny surface. Many knife makers today are leaving the ground finish (as we desire) to provide the mat appearance or to meet the customer's specification. Polishing if performed on a blade with tool marks on it will leave a cheap and wavy looking surface finish.

As a manufacturing process grinding is extensively used where high dimensional compliance (very small tolerances), fine surface finish, or when working with very hard materials are involved.

Gauges used in firearms inspection as well hydraulic pistons for example, are ground finished and appear to be almost chrome like in appearance. Polishing would not enhance the surface finish and would cause slight deformation (ovality) in these products. A ground finish is very uniform and functional.

All other terms and conditions remain the same.
