6. STATEMENT OF WORK

1. Background:

The scientific authority is leading studies on the deposition of polycyclic aromatic compounds (PACs) in lake sediments under the Joint Oil Sands Monitoring Program. In this program sediment cores have been collected from 6 lakes in the oil sands region in 2014 which need to be analysed for PACs. Previous work under the same program has involved analysis of PACs in cores from 18 lakes in the region. As a result of this previous work the analytical methodology is well defined as is the list of analytes and therefore compatibility with previous work is essential.

We are seeking an outside laboratory to conduct the analyses of PACs in the sediment samples. The contracted laboratory would be required to demonstrate that it has the necessary experience and instrumentation to conduct the analysis and that it can meet rigorous quality assurance criteria including low laboratory blank contamination, consistency of performance in the analysis of certified reference materials, and evidence of contributions to scientific publications on mercury isotope ratios in sediments.

2. Scope of work:

Samples

The selected analytical lab would be provided with frozen, unprocessed, sediments (in labelled screw capped polypropylene jars) by the Scientific Authority as well as related information on the samples such as slice depth, lake name, etc to aid in the efficient processing of the samples.

Methodology

Surrogates: All samples must be spiked with deuterated surrogate standards prior to extraction

Extraction: Sediment should be Soxhlet extracted with dichloromethane. Use of pressurized liquid extraction technology is acceptable as well.

Column chromatography cleanup: Extracts must be routinely cleaned column chromatography on Silica gel. Additional steps that may be required include gel permeation column chromatography and treatment with activated copper to remove sulfur.

Instrumental analysis

Gas chromatography-mass spectrometry must be used. Instrumental analysis should be performed by low-resolution mass spectrometry (LRMS) with an RTX-5 capillary GC column

(or equivalent high performance column). The LRMS must be operated at a unit mass resolution in the electron impact (EI) ionization mode using multiple ion detection (MID) acquiring at least one characteristic ion for each target analyte and surrogate standard. Use of high resolution mass spectrometry is also acceptable but not essential.

For compatibility with previous work conducted on lake sediment cores under the Joint Oil Sands Monitoring Plan, 74 parameters (20 unsubstituted PACs, 28 alkylated PAC groups, and 26 individual alkylated PACs) must be analysed. A full list of analytes is provided below in Section 3, at the end of Subsection 6.

Analyte identification: Individual chromatographic peak should be identified as a target compound if:

1. Peak responses must be at least three times the background noise level.
2. The retention time must be within three seconds of that predicted from the calibration run and the sample retention time reference (labelled compound).
3. Peak centroids for the quantification and confirmation ions must coincide within two seconds.
4. The relative ion abundance ratios must be within 20% of the opening calibration values.
5. Alkylated PACs should be identified based on comparison of the sample chromatogram retention times and peak patterns to those of a qualitative reference sample. Retention time windows for Alkylated PAC should be determined from a retention time reference extract run at the beginning of the instrumental run.
6. Two mass fragments must be monitored for each of the target analytes and their associated deuterated surrogate standard. Each pair of masses must provide a response within a given ratio to be a valid or "ratioing" peak
7. The list of individual alkylated standards must include labeled (deuterated) surrogates where available.

Concentrations of target PACs must be calculated using the isotope dilution method of quantification, by comparing the area of the quantification ion to that of the corresponding deuterium-labelled standard and correcting for response factors. Response factors should be determined daily using authentic PACs.

Concentrations in sediments should be reported on a dry weight basis. Therefore % moisture should be determined and reported.

PACs, Alkylated PACs, and Alkylated PAC groups should be all analyzed in one GC-MS run.

Quality Assurance

The source and batch of certified labelled and unlabeled external standards must be documented

Initial calibration should be performed using a five point calibration series of solutions that encompass the working concentration range. Calibration procedures should use the mean

RRFs determined from the initial calibration to calculate analyte concentrations. Calibration should be verified at least once every 12 hours by analysis of a mid-level calibration solution.

Sample Specific Detection Limits are acceptable. These should be determined individually for every sample analysis run by converting the area equivalent of 3.0 times the estimated chromatographic noise height to a concentration in the same manner that target peak responses are converted to final concentrations.

Samples should be analyzed in batches with the following composition:

- Blanks - One procedural blank is analyzed for each batch. The procedural blank should be prepared by spiking an aliquot of the surrogate standard solution into a clean matrix.
- Precision and Recovery Samples –Include analysis of a spiked reference matrix (SPM) analyzed with each batch. The OPR sample should be prepared by spiking an aliquot of the authentic spiking solution into an accurately weighed in-house reference matrix (known to contain low background levels of target analytes).
- Duplicates – A sample duplicates should be analyzed for batches with 7-20 test samples.
- Reference Samples – Certified reference materials should be used to validate and periodically check methods. The preferred CRM is National Institute of Standards & Technology SRM 1944 for compability with previous datasets.

Accreditation and Participation in interlaboratory comparisons

The analytical laboratory and the specific methodology employed for PACs must be accredited through Canadian Association for Laboratory Accreditation (CALA). Successful participation in interlaboratory comparison exercises for alkylated PACs must also be provided. For example, in programs that have included PACs and alkylated PACs conducted by reference bodies such as NIST and the US Fish and Wildlife Service. Success participation would be demonstrated by results for PACs and alkylated PACs and comparison with consensus values from the program.

Reporting, Timeliness, and Deliverables

Electronic copies of data reports will be provided to the Scientific Authority on completion of sample analysis. Electronic copies of all sample and QA chromatograms and calculations must be available upon request. Analyses must be completed by 31 January 2015.
