

**QUESTION & ANSWER #3**

**SOLICITATION K2AA0-14-0017**

**Sampling Campaign for 2-Propanone, reaction products with diphenylamine  
(PREPOD – CAS RN 68412-48-6)**

**Question 1:**

It is understood that the specialized analyses for this mandate will be conducted at EC's Burlington laboratory. In preparing our Work Plan, could you please confirm the TAT (turn-around time) to receive the results of the analyses?

**Answer to Question 1:**

The analyses and the results will be done at EC laboratory and will not be part of the work plan and report of either Phase I or II.

Therefore the contractor does not have to wait for the results to complete its report. As indicated in the ToR, the contractor will prepare a final report about the sampling campaign but not on the results of the analyses.

The initiation of Phase II will depend upon the test results of Phase I. Environment Canada's Laboratory will start analyzing the samples as soon as possible once they have been received. Environment Canada will contact the contractor as soon it is able if Phase II of the work is required.
