Final Report

File No. 121412551

Date: May 6, 2013

EXECUTIVE SUMMARY

Stantec Consulting Ltd. (Stantec) was retained by Public Works and Government Services Canada (PWGSC) to carry out a Phase II Environmental Site Assessment (ESA) at the Canadian Coast Guard (CCG) Southside Base located off Southside Road in St. John's, Newfoundland and Labrador (NL). Refer to Drawing No. 121412551-EE-01, Appendix A. The Phase II ESA was completed in conjunction with a Geotechnical Investigation which was reported under separate cover (Stantec Project No. 121412551, dated March 22, 2013 in Draft) for Public Works and Government Services Canada. The purpose of the Phase II ESA was to confirm the absence/presence of environmental impacts in soil and groundwater on the subject property.

The Phase II ESA was carried out between February 20, 2013 and March 28, 2013 and included of the drilling of fifteen (15) boreholes complete with monitor wells at the site. Twelve (12) geotechnical/environmental boreholes (*i.e.*, BH1 to BH12) were placed on the eastern portion of the site at locations selected by PWGSC and provided to Stantec. On the western portion of the site, three (3) additional environmental boreholes complete as monitor wells (*i.e.*, BH13 to BH15) were installed. All sampling locations are shown on Drawing No. 121412551-EE-02, Appendix A. The results of the Phase II ESA are as follows:

1. Fill materials were encountered underlying the surficial layer of asphalt or reinforced concrete slab at all borehole locations. The thickness of the fill ranged from 0.6 m in borehole BH11 to as much as 6.9 m in BH2. Underlying the fill layer was a stratum of very loose to compact, brown to black, silty sand with gravel with trace to frequent amounts of organic matter consistent with a marine depositional environment (*i.e.*, marine sediment). This stratum was encountered in boreholes BH1 to BH4, BH6, BH7, BH13 and BH14; and ranged in thickness from 0.13 m in borehole BH14 to as much as 3.7 m in borehole BH1. A native glacial till layer was encountered underlying the fill or marine sediment in all boreholes except in BH8 and BH10 to BH12. The till ranged in thickness from 0.3 m in borehole BH07 to 4.1 m in borehole BH2. Bedrock was encountered in all boreholes except boreholes BH13 to BH15, where these were advanced to a predetermined depth of about 4.5 m for the installation of groundwater monitoring wells. Depth of bedrock varied from about 0.8 m in borehole BH11 to 11.6 m in borehole BH2.
2. The depths to groundwater in the boreholes and monitor wells, as measured between February 24, 2013 and March 12, 2013 during groundwater sampling, ranged from 0.50 mbgs in monitor well BH10 to 2.42 mbgs in monitor well BH15. Groundwater levels within these monitor wells are expected to vary seasonally and in response to individual precipitation events.
3. Based on the local topography and the measured groundwater levels, the inferred direction of local groundwater flow at the site is towards the St. John's Harbour to the northwest.

4. Free liquid phase petroleum hydrocarbons were not observed on soil or groundwater in any of the monitor wells.
5. Petroleum Hydrocarbons
 - a. The concentrations of F1, F2 and F3 PHC and/or BTEX detected in soil samples from boreholes BH1 to BH4 and BH6 on the eastern portion of the site and boreholes BH13 to BH15 on the western portion of the site exceeded the applicable guidelines.
 - b. The concentrations of F1, F2 and/or F3 PHC detected in groundwater samples from boreholes BH6, BH8 and BH11 on the eastern portion of the site and borehole BH15 on the western portion of the site exceeded the applicable guidelines.
6. Metals
 - a. The detected concentrations of one (1) or more metal parameters in soil samples from boreholes BH2, BH3 and BH4 on the eastern portion of the site and boreholes BH14 and BH15 on the western portion of the site exceeded the applicable guidelines.
 - b. The detected concentrations of one (1) or more metal parameters in groundwater samples from boreholes BH1, BH2, BH4, BH5, BH7, BH8 and BH11 on the eastern portion of the site and boreholes BH13 and BH15 on the western portion of the site exceeded the applicable guidelines.
7. PAHs
 - a. The detected concentrations of one (1) or more PAH parameters in soil samples from boreholes BH4 and BH5 on the eastern portion of the site and borehole BH14 on the western portion of the site exceeded the applicable guidelines.
 - b. The detected concentrations of one (1) or more PAH parameters in groundwater samples from boreholes BH1, BH2, BH5, BH6, BH8 and BH11 on the eastern portion of the site exceeded the applicable guidelines. However, it was noted during the laboratory analysis that the groundwater samples contained sediment. Because sediment was present in the groundwater samples, it is possible that the PAHs concentrations were influenced by PAH impacted sediment in the groundwater, rather than PAHs in solution in the groundwater.
8. See Drawing No. 121412551-EE-03 in Appendix A for the approximate extent of PHCs, metals and/or PAH concentrations in soil and groundwater exceeding applicable guidelines.
9. Polychlorinated Biphenyls (PCBs) - Concentrations of PCBs were not detected in the soil or groundwater samples analyzed.
10. Total Oil and Grease - Concentrations of total oil and grease were detected in the soil samples analyzed from boreholes BH2, BH5, BH6 and BH8 on the eastern portion of the site and boreholes BH13 and BH15 on the western portion of the site.

11. Leachate in Soil - Leachability for petroleum hydrocarbons, lead, fluoranthene, naphthalene and phenanthrene was carried out on four (4) soil samples (*i.e.*, BH6-SS4, BH14-SS3, BH14-AS3C and BH15-SS3). Concentrations of lead were detected in the leachate from the tested samples, but they did not exceed the regulatory guideline (*i.e.*, 5,000 µg/L). Note that there are no regulatory guidelines for petroleum hydrocarbons, lead, fluoranthene, naphthalene and phenanthrene in leachate.
12. General Chemistry in Groundwater - The measured pH in groundwater samples from boreholes BH2, BH4, BH5, BH6, BH8 and BH11 on the eastern portion of the site was not within the applicable guideline.
13. Radon
 - a. Preliminary radon gas monitoring (*i.e.*, a screening survey) was carried out on March 28, 2012 from one borehole/monitor well (*i.e.*, BH6) to assess whether radon gas was present at the site.
 - b. Radon concentrations from the borehole/monitor well ranged from 291 becquerels per cubic metre (Bq/m³) to 837 Bq/m³, with an average over four (4) hours of 558 Bq/m³. Because subsurface soil gas vapours were measured, any predicted indoor air concentration would be expected to be much less due to dilution with ambient air; however there is no known correlation between soil gas measurements pre-construction and an indoor concentration. There is also no known federal environmental guideline for radon in soil gas or for radon in ambient air within a commercial property. As a reference, Health Canada recommends remedial measures within a residential property whenever the average annual radon concentration exceeds 200 Bq/m³ in the normal occupancy area.

Based on the conclusions of the current Phase II ESA, Stantec offers the following recommendations:

1. It is possible that the PAHs concentrations in groundwater were influenced by PAH impacted sediment, rather than PAHs in solution in the groundwater. Collect additional groundwater samples from monitor wells BH1, BH2, BH5, BH6, BH8 and BH11 using a low flow pump to reduce sediment interference and submit for laboratory analysis of PAHs. Request that the laboratory decant the groundwater sample prior to analysis to further reduce sediment interference.
2. Identify any data gaps present and conduct a Human Health and Ecological Risk Assessment (HHERA) to evaluate potential risks to human and ecological receptors associated with residual chemical contamination on the subject site.
3. Identify the requirements for remediation and/or risk management based on the results of the risk assessments.
4. Any personnel engaged in construction and/or excavation on the site should be advised of the potential risks associated with dermal contact or ingestion of soil that contains contaminants of potential concern. A risk management plan (RMP) should be

implemented prior to excavation activities. The RMP will outline the personal protective equipment (PPE) requirements (gloves, closed toed boots and coveralls) and will discuss the recommended actions to follow if exposed (washing with soap and water, cleaning of PPE, etc.).

5. Because petroleum hydrocarbons and metal exceedances were detected in site soil, should the property be redeveloped, any excess soil generated by the redevelopment should be tested prior to leaving the site to determine soil disposal options.
6. If site conditions or land uses change (e.g., residential usage, potable groundwater or if further development takes place on the site), the results of the on-site risk assessment may need to be revisited to ensure that there are no additional or increased risks to potential receptors, on-site or off-site.
7. It is our understanding that there is no current groundwater use for potable drinking water. The assumption is made that prior to any future use of groundwater for potable drinking water or other human use (*i.e.*, showering, washing), the groundwater will be tested to demonstrate that groundwater quality is within the Guidelines for Canadian Drinking Water Quality.
8. Based on the detected radon concentrations in short-term monitoring of soil gas on the site, the following is recommended:
 - a. Follow the recommendations for radon preventative construction methods for new construction found in the Canadian National Building Code 2010 such as controlling air leakage with a sub-slab seamless vapour barrier and providing a ventilation system. These construction methods should mitigate the ingress of airborne radon from the ground. Another useful guide for construction is the United States Environmental Protection Agency (EPA) "EPA/625/R-92/016 Radon Prevention in the Design and Construction of Schools and Other Large Buildings, 1994".
 - b. A long term sampling program is recommended within the building post construction to determine actual indoor air radon concentrations. Follow the guidance found in the "Health Canada Guide for Radon Measurements in Public Buildings (Schools, Hospitals, Care Facilities, Detention Centres), 2008". Health Canada recommends that the radon test performed in a home or public building be a long-term measurement. Health Canada does not recommend a test of duration less than one (1) month, a minimum of three (3) months is recommended and twelve (12) months is optimum.

The statements made in the Executive Summary are subject to the same limitations included in the Closure Section 5.0 and are to be read in conjunction with the remainder of this report.

1.0 INTRODUCTION

Stantec Consulting Ltd. (Stantec) was retained by Public Works and Government Services Canada (PWGSC) to carry out a Phase II Environmental Site Assessment (ESA) at the Canadian Coast Guard (CCG) Southside Base, Berth 28 located off Southside Road in St. John's, Newfoundland and Labrador (NL). Refer to Drawing No. 121412551-EE-01, Appendix A. The Phase II ESA was completed in conjunction with a Geotechnical Investigation, which was reported under separate cover (Stantec Project No. 121412551, dated March 22, 2013 in Draft) for Public Works and Government Services Canada. The purpose of the Phase II ESA was to confirm the absence/presence of environmental impacts in soil and groundwater on the subject property.

This report is presented in six sections. Section 1 presents background information about the site, describes the scope of work, and explains the regulatory guidelines and their applicability. Section 2 summarizes the methodology used for the Phase II ESA. Section 3 provides results of the Phase II ESA and laboratory analyses. Section 4 provides the conclusions and the recommendations of the report. Limitations of the work are discussed in Section 5 and references are provided in Section 6. Supporting information is provided in the appendices at the end of this report.

This report was prepared specifically and solely for the above project. The report presents all of the factual findings and laboratory results of the Phase II ESA and presents Stantec's comments on the environmental status of the site.

1.1 Site Description

Based on information provided in PWGSC's project Terms of Reference (TOR) dated December 20, 2013, the CCG Southside Base Site is located on the Southside Road in St. John's, NL. The site currently consists of the Administration Building, the Buoy Maintenance Facility, Berth 28 and the Hazardous Materials Storage Area. The area of current study (*i.e.*, this Phase II ESA) is the area adjacent to the Buoy Maintenance Facility known as Berth 28 (Pier 28).

Berth 28 is currently being used as an equipment storage yard and parking area for the CCG Southside Base. The site is intended to be the future location of the CCG Southside Base office tower. The office tower will be located on the eastern portion of the site between the property boundary and the City of St. John's sewer outfall. Although the final design is unknown, it will be a multi-story office tower with a footprint of approximately 1,000 m² to 2,000 m². Design of the building is planned to begin in 2013 and construction will commence following any site remediation.

The subject site is located in an industrial area along the southside of the St. John's Harbour front. The CCG Buoy Maintenance Facility of the CCG Southside Base (Pier 29) is located adjacent to the southwest of the site. To the northeast of the site is HMCS Cabot (Pier 27).

Southside Road is located to the southeast of the site and the waters of St. John's Harbour are to the northwest.

The Berth 28 property is approximately 1 ha in area consisting of the concrete deck/wharf and the land up-gradient of the wharf. Southside Road, which borders the property to the southeast, provides site access.

Based on existing data for the area, the principal natural overburden material, beneath surficial fill material, is considered to be glacial till, which directly overlies bedrock. The characteristic permeability of these soils is moderate. Based on the local topography and the groundwater levels noted in the monitor wells placed for this assessment, the direction of groundwater flow at the site is to the northwest towards St. John's Harbour. The direction of regional groundwater flow is also towards the northwest. Groundwater on the Site and in the general area of the Site is not utilized as a source of drinking water.

1.2 Background

The following is a list of previous environmental reports that have been completed either at the subject site or nearby sites and provided to Stantec by PWGSC for review as part of the current investigation:

- Environmental and Geotechnical Assessment, HMCS Cabot Armoury, Pier 27, St. John's, NL, Newfoundland Geosciences Limited, March 1999. (NGL Project 5691);
- Phase II Environmental Site Assessment at Canadian Coast Guard Base, Berth 28, Southside, St. John's Harbour, St. John's, NL, MGI Limited, November 2001;
- Phase II/II Environmental Site Assessment, CCG South Side Base, Administration Building, Buoy Maintenance Facility, Berth 28 and Hazardous Materials Storage Area, St. John's, NL, AMEC Earth & Environmental, March 2002;
- Phase II Environmental Site Assessment, Water Lot Sediment Sampling, Canadian Coast Guard Southside Base, St. John's, NL, AMEC Earth & Environmental, April 2002;
- Groundwater Monitoring Program, Canadian Coast Guard Southside Base, Administration Building, Buoy Maintenance Facility, Berth 28 and Hazardous Materials Storage Area, St. John's, NL, AMEC Earth & Environmental, March 2004;
- Groundwater Monitoring Program, Canadian Coast Guard Southside Base, Administration Building, Buoy Maintenance Facility, Berth 28 and Hazardous Materials Storage Area, St. John's, NL, AMEC Earth & Environmental, October 2005; and,
- Groundwater Monitoring Program, Canadian Coast Guard Southside Base, Administration Building, Buoy Maintenance Facility, Berth 28 and Hazardous Materials Storage Area, St. John's, NL, AMEC Earth & Environmental, March 2007.

In 1999, an Environmental and Geotechnical Assessment was completed on the adjacent HMCS Cabot Armoury property to the northeast of the subject site. This was completed during the site preparation phase for the construction of a new building. The investigation involved the

placement of eight (8) test pits and a test excavation on the site. The overlying soils encountered throughout the site consisted of fill (with some debris and wood), marine soils and glacial till. The analytical results of the soil samples identified petroleum hydrocarbon and polycyclic aromatic hydrocarbons (PAHs) impacts exceeding regulatory guidelines. Contaminated soils exceeding guidelines were removed and disposed of, but areas of contaminated soil were left along the harbor side of the site due to close proximity to St. John's Harbour. During the excavation and removal of unsuitable material on the site, a pocket of soil was encountered with an organic odour. The area (Pier 27) was reportedly used in the past to handle or process seal oil. Analytical testing of the soil found that the non-petroleum oil and grease fraction of the samples could be attributed to seal oil.

In 2001, a Phase II ESA was completed at the CCG Base, Berth 28 (the subject site for this assessment). The investigation involved the placement of ten (10) test pits on the site. Refer to Drawing No. 121412551-EE-02 in Appendix A for the locations of the test pits. Samples collected from the test pits were analyzed for petroleum hydrocarbons (*i.e.*, total petroleum hydrocarbons (TPH) and benzene, toluene, ethylbenzene and xylenes (BTEX)), metals and PAHs. Petroleum hydrocarbons were detected in all of the test pits, with four (4) test pits (*i.e.*, TP104, TP106, TP107 and TP110) having concentrations that exceeded applicable guidelines at that time. Metals were detected in all of the test pits, with six (6) test pits (*i.e.*, TP101 to TP103, TP105, TP106 and TP107) having concentrations that exceeded applicable guidelines at that time. PAHs were detected in the six test pits that were sampled, with five (5) test pits (*i.e.*, TP101, TP103, TP105, TP106 and TP107) having concentrations that exceeded applicable guidelines at that time.

In 2002, a Phase II/III ESA was completed on the adjacent CCG Southside Base to the southwest of the subject site. The investigation involved the placement of monitor wells and associated soil and groundwater sampling for petroleum hydrocarbons, total oil and grease, mineral oil and grease, metals, PAHs and PCBs. At the Administration Building, there were petroleum hydrocarbon and PAH impacts in one (1) soil sample that exceeded applicable guidelines at that time. Total oil and grease were detected in the six (6) monitor wells near the Administration Building. PAH impacts in groundwater exceeding guidelines were found in five (5) monitor wells and metal impacts in groundwater exceeding guidelines were found in six (6) monitor wells near the Administration Building. At the Buoy Maintenance Facility, petroleum hydrocarbon impacts exceeding guidelines were found in one (1) monitor well and total oil and grease were detected in two (2) monitor wells. PAH and metal impacts in groundwater exceeding guidelines were found in two (2) monitor wells near the Buoy Maintenance Facility. Total oil and grease were detected in the three (3) monitor wells near the Hazardous Materials Storage Area. Metal impacts in groundwater exceeding guidelines were found in three (3) monitor wells near the Hazardous Materials Storage Area.

In 2002, Waterlot Sediment Sampling was conducted at the CCG Southside Base. The scope of work included the collection of 10 ocean bottom sediment samples and the laboratory analysis for petroleum hydrocarbons, metals, PAHs and PCBs. Concentrations of TPH in the samples ranged from 3.6 mg/kg to 6,900 mg/kg. Concentrations of various metal parameters in all of the sediment samples and PAH parameters in nine (9) samples exceeded the applicable guidelines. Concentrations of PCBs in one (1) sample exceeded the applicable guideline.

In 2004, Groundwater Monitoring was carried out at the CCG Southside Base to the southwest of the subject site. The field program included the monitoring and sampling of ten (10) monitor wells at the site (one was not accessible). Selected groundwater samples were submitted for the laboratory analysis of petroleum hydrocarbons, metals, PAHs and PCBs. Metal impacts in groundwater exceeding guidelines were found in five (5) monitor wells and PAH impacts in groundwater exceeding guidelines were found in one (1) monitor well near the Administration Building. Metal impacts in groundwater exceeding guidelines were found in two (2) monitor wells near the Buoy Maintenance Facility. Metal impacts in groundwater exceeding guidelines were found in three (3) monitor wells near the Hazardous Materials Storage Area.

In 2005, Groundwater Monitoring was carried out again at the CCG Southside Base to the southwest of the subject site. The field program included the monitoring and sampling of eleven (11) monitor wells at the site. Selected groundwater samples were submitted for the laboratory analysis of petroleum hydrocarbons, metals, PAHs and PCBs. Metal impacts in groundwater exceeding guidelines were found in five (5) monitor wells and PAH impacts in groundwater exceeding guidelines were found in three (3) monitor wells near the Administration Building. Metal impacts in groundwater exceeding guidelines were found in two (2) monitor wells near the Buoy Maintenance Facility. Metal impacts in groundwater exceeding guidelines were found in two (2) monitor wells near the Hazardous Materials Storage Area.

In 2007, Groundwater Monitoring was carried out again at the CCG Southside Base to the southwest of the subject site. The field program included the monitoring and sampling of ten (10) monitor wells at the site (one was not accessible). Selected groundwater samples were submitted for the laboratory analysis of petroleum hydrocarbons, metals, PAHs and PCBs. Metal impacts in groundwater exceeding guidelines were found in four (4) monitor wells and PAH impacts in groundwater exceeding guidelines were found in five (5) monitor wells near the Administration Building. Metal impacts in groundwater exceeding guidelines were found in two (2) monitor wells and PAH impacts in groundwater exceeding guidelines were found in one (1) monitor well near the Buoy Maintenance Facility. Metal impacts in groundwater exceeding guidelines were found in three (3) monitor wells and PAH impacts in groundwater exceeding guidelines were found in one (1) monitor well near the Hazardous Materials Storage Area.

1.3 Objectives

The objectives of the proposed program for the subject site as per the project's Terms of Reference (TOR) are summarized as follows:

1. Conduct a document review to determine any data gaps and to develop a plan for further assessment.
2. Complete a detailed intrusive investigation to delineate the horizontal and vertical extent of contamination in all impact media.
3. Complete a geotechnical study during the completion of the detailed intrusive investigation (completed under separate cover).
4. Complete all the work within the required time frame.

1.4 Scope of Work

Stantec understood that the primary goal of the current project was to be the first step in determining what remediation may be required at the site to allow the construction of a new office tower. The investigation focused on two separate areas as follows:

1. Eastern portion of the property between the boundary with the HMCS Cabot property to the east and the City of St. John's sewer outfall where the proposed office tower will be constructed. As part of the current program, both a geotechnical study and an environmental site assessment were completed in this portion of the property.
2. Western portion of the property between the boundary with the existing CCG Southside Base property to the east and the City of St. John's sewer outfall. As part of the current program, study in this area was limited to environmental assessment only.

The current Phase II ESA was conducted concurrently with the Geotechnical Investigation and involved the placement of fifteen (15) boreholes (with all completed as monitor wells) at the subject site and associated soil and groundwater sampling and analysis. The purpose of the Phase II ESA was to confirm the presence or absence of contamination at the site in the areas of the intrusive investigation. Specifically, the scope of work for the current Phase II ESA carried out by Stantec on the subject property included the following components of work:

1. Determine the appropriate locations and install up to fifteen (15) boreholes complete with monitor wells (5) at the site. Twelve (12) geotechnical/environmental boreholes (*i.e.*, BH1 to BH12) were placed on the eastern portion of the site at locations selected by PWGSC and provided to Stantec. Boreholes were drilled through overburden and up to 6 m into bedrock for geotechnical and environmental purposes. On the western portion of the site, three (3) additional environmental boreholes complete as monitor wells (*i.e.*, BH13 to BH15) were installed to a depth of approximately 5 m for environmental purposes only.
2. Collect soil samples from the fifteen (15) boreholes for laboratory analysis;
3. Carry out head space vapour screening to select soil samples for laboratory analysis;
4. Collect groundwater samples from the fifteen (15) groundwater monitor wells;
5. Submit selected soil and groundwater samples for laboratory analysis of petroleum hydrocarbons, including TPH and BTEX parameters, fractionated petroleum hydrocarbons, metals, PAHs, PCBs, total oil and grease as well as general chemistry, as required;
6. Carry out radon soil gas monitoring in one monitor well completed on the eastern portion of the site using an ALPHA II Radon Monitor; and,
7. Evaluate observations and results of the investigation and present in a Phase II ESA report, which includes drawings and monitor well logs and outlines the methodology, results, conclusions and recommendations from the investigation.

1.5 Regulatory Framework

1.5.1 Petroleum Hydrocarbons in Soil

As the site is federally-owned, federal guidelines for petroleum hydrocarbons have been referenced. The Canadian Council of Ministers of the Environment (CCME) Canada Wide Standard (CWS) for Petroleum Hydrocarbons (PHC) in Soil is a three tiered, risk based remedial standard for contaminated soil. Standards have been developed for four generic land uses – agricultural, residential/parkland, commercial, and industrial. For the purposes of the CWS, PHC are considered to be comprised of four fractions, these being Fraction 1 (F1): C₆-C₁₀, Fraction 2 (F2): >C₁₀-C₁₆, Fraction 3 (F3): >C₁₆-C₃₄, and Fraction 4 (F4): >C₃₄-C₅₀. The CWS is based on a tiered approach to site management. Within this tiered approach, three tiers of increasing technical complexity (Tier I, II and III) are available for the management of impacted sites. The same high level of environmental and human health protection is required at all three tiers. Tier I levels are used when the proponent accepts the base assumptions and parameters in the Tier I exposure scenarios. Tier 2 levels may be generated and used when site conditions exist that significantly modify the exposure and risk scenarios. Tier 3 levels are based on site-specific assessment and management of risks.

As a result of this tiered approach, the clean-up criteria defined under the guidance document allow for greater flexibility in managing contaminated sites.

For a Tier 1 assessment, the most stringent pathway-specific Tier 1 level for petroleum hydrocarbons in surface soil is used (Tables 2 and 3 in the CWS for PHC in Soil, User Guidance, January 2008). These standards are based on default conditions for typical sites and exposure pathways and are classified by land use and soil type. In addition, the petroleum hydrocarbon standards are dependent on the defined four hydrocarbon fractions (*i.e.*, the standards differ for F1, F2, F3, and F4).

Based on the CCME CWS for PHC user guidance document, if site concentrations exceed the Tier 1 CWS for PHC, the site may be remediated to the Tier 1 generic standards. Alternatively, a comparison of the site concentrations to the Management Limit (Tables 2 to 5 in the CWS for PHC in Soil, User Guidance, January 2008) may be conducted. If the PHC concentrations are below the Management Limits for that land use, then a comparison to the exposure pathway specific values (Tables 2 to 5 in the CWS for PHC in Soil, User Guidance, January 2008) may be conducted. If the Management Limits are exceeded, however, there is a need for field quantization of the following factors prior to applying the exposure pathway specific values:

- No free phase formation;
- No exposure of workers in trenches to PHC vapours;
- No fire and explosion hazards;
- No effects on buried infrastructure; and,
- No aesthetic considerations.

The CWS for PHC in soils exclude known carcinogens such as benzene, as well as toluene, ethylbenzene and xylenes (TEX), which are addressed separately as individual target compounds. The concentrations of benzene, toluene, ethylbenzene and xylenes in soil on the Site were compared to the CCME Canadian Soil Quality Guidelines (CSQGs) (CSQG on-line 2013). The CCME CSQGs are developed on the basis of land use. The Site is publicly accessible and adjacent property use includes commercial land. The commercial guidelines are used as initial screening values for this assessment for the Site.

1.5.2 Metals, PAHs, PCBs and General Chemistry in Soil

The applicable federal guidelines for metals and general chemistry in soil are considered to be the CCME Canadian Environmental Quality Guidelines and its associated documents. The CCME guidelines provide limits for contaminants in soil and are intended to maintain, improve, and/or protect environmental quality and human health at contaminated sites in general. These criteria include numerical values for the assessment and remediation of soil in the context of agricultural, residential/parkland, commercial, and industrial land uses. In addition to land use, the CCME include numerical values depending on soil texture (*i.e.*, coarse or fine grained soils). Environmental soil and water quality guidelines are derived using toxicological data to determine the threshold level to key receptors. These criteria include the CCME Canadian Soil Quality Guidelines (CSQGs). The latest update of the CCME CSQGs was obtained on-line at <http://ceqg-rcqe.ccme.ca/>. More specifically, the guidelines for a commercial site and coarse grained soil were selected.

1.5.3 Petroleum Hydrocarbons, Metals, PAHs, PCBs and General Chemistry in Groundwater

The Federal Contaminated Sites Action Plan (FCSAP) was established to help federal departments, agencies and custodians address federal contaminated sites, so as to reduce environmental and human health risks as well as federal financial environmental liability associated with the higher risk federal contaminated sites.

The Environment Canada (EC) Federal Interim Groundwater Quality Guidelines (FIGQGs) last updated November 2012 were developed to assist federal custodians in assessing, remediating/risk managing federal contaminated sites funded under FCSAP. Federal custodians are advised to use these interim guidelines as an interim measure until Canadian groundwater quality guidelines are available. The EC guidelines are interim guidelines that are protective of aquatic life.

The EC guidelines follow a tiered framework, consistent with the Canadian Soil Quality Guidelines development through the CCME. A Tier 1 approach is a direct application of the generic numerical guidelines; specifically, application of the lowest guideline for any exposure pathway. A Tier 2 approach allows for the development of site-specific remediation objectives through the consideration of site-specific conditions, by modifying (within limits) the numerical guidelines based on site-specific conditions and focusing on exposure pathways and receptors that are applicable to the site. Finally, a Tier 3 approach uses the site-specific risk assessment to develop site-specific remediation objectives. Based on the existing site conditions for the

subject site, the FIGQGs for marine life for a site with commercial/industrial land use and coarse-grained soil are applicable at the site for BTEX parameters, metals, PAHs, PCBs and general chemistry parameters.

Stantec has also utilized the Ontario Ministry of the Environment's (MOE) Soil, Groundwater and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act, April 2011, for a full-depth generic site with non-potable groundwater. The MOE groundwater guidelines are protective of aquatic receptors in surface waters which could be affected by the discharge of groundwater. Stantec has applied the MOE guidelines for other environmental investigations where no applicable federal guidelines exist, and has obtained regulatory acceptance.

1.5.4 Leachate

The guideline used for leachability of parameters from soil was the Environment Canada, Interprovincial Movement of Hazardous Waste and Hazardous Recyclable Material Regulations, Schedule 2 (Table of Hazardous Constituents Controlled Under Leachate Test and Regulated Limits), January 2002.

2.0 METHODOLOGY

2.1 Boreholes and Monitor Wells

For this project, a total of fifteen (15) boreholes were completed, labeled consecutively as BH1 to BH15. Groundwater monitoring wells were installed in all boreholes after completion of drilling (MW1 to MW15). As specified in the Terms of Reference, twelve (12) boreholes identified as BH1 to BH12 were advanced on the eastern portion of the site, where practical, up to 6.0 m into bedrock for geotechnical and environmental purposes. On the western portion of the site, three (3) additional environmental boreholes complete as monitor wells (*i.e.*, BH13 to BH15) were installed to a depth of approximately 4.5 m for environmental purposes only.

Borehole locations were selected by the client and located in the field by Stantec personnel referencing known infrastructure. Final as-advanced borehole locations were located with the assistance of Hawco King Renouf/Allnorth Consultants (Allnorth) of St. John's, NL. Final as-advanced borehole locations were surveyed in reference to NAD 83 geodetic datum and MTM Zone 1 coordinate system and are shown on the Sample Location Plan, Drawing No. 121412551-EE-02, Appendix A.

Individual Borehole Records/Monitor Well Records are attached in Appendix B and accompanied with the following explanatory keys; Symbols and Terms Used on Borehole and Test Pit Records, and Symbols and Terms Used on Monitor Well, Water Well and Environmental Records.

The intrusive field investigation work (borehole advancement) was carried out from February 20, 2013 to March 7, 2013. The field work was conducted under the supervision of experienced personnel from Stantec who maintained detailed logs and obtained representative samples of the various soil and rock strata encountered.

The boreholes were drilled using a Model CME-75 all-terrain-vehicle-mounted drill rig equipped for soil sampling and diamond coring of bedrock. The boreholes BH13 to BH15 were advanced using 210 mm outside diameter, continuous flight hollow stem augers (HSA). Boreholes BH1 to BH12 were initially advanced using a 100 mm outside diameter, continuous, solid stem auger for about the first two (2) metres, then advanced using wet-rotary diamond drilling methods using a HQ-sized drill stem of 96 mm outside diameter.

Where possible, soil samples were collected from the boreholes during the performance of the Standard Penetration Test and N values were recorded. Soils were sampled from the boreholes by split spoon methods at approximately 0.6 m intervals. The soil samples were examined for any field evidence of petroleum hydrocarbon impacts at the time of collection. Duplicate soil samples were collected at each sample location, where possible. The samples were placed in new laboratory-supplied glass jars and placed in sample coolers and returned to Stantec's office in St. John's, NL for soil vapour testing. Head space soil vapour concentrations were measured in the duplicate sample jars using a MiniRAE 2000 photo ionization detector (PID). The PID readings are presented on the Monitor Well Records in Appendix B.

Based on the PID readings, site observations and site history, selected soil samples were submitted to Maxxam Analytics in St. John's, NL and Bedford, NS for laboratory analysis of petroleum hydrocarbons (TPH and BTEX), TPH fractionation, available metals, PAHs, PCBs and total oil and grease.

Following drilling, monitor wells were installed within the boreholes. The monitor wells consisted of a 50 mm diameter, flush-threaded, Schedule 40 PVC casing and No. 10 slot screen. Three (3) meters of No. 10 slot screen and 1.5 m of schedule 40 PVC casing were placed in each borehole. No. 3-4 silica sand was placed around the screened section. The screened section was placed to span the water table as measured at the time of drilling. A bentonite seal was placed above the sand pack, followed by backfill material to the surface. A flush-mounted, cast iron or aluminum well head enclosure was installed at each monitor well. Specific well construction details are shown on the Monitor Well Records in Appendix B.

Preliminary radon gas monitoring (*i.e.*, a screening survey) using a radon detector was carried out on March 28, 2012 from one borehole/monitor well (*i.e.*, BH6) to assess whether radon gas was present at the site.

2.2 Groundwater Sampling

Following monitor well installation, each well was developed by pumping approximately forty (40) L to eighty (80) L of groundwater. Monitor well development was completed to reduce any sediment that may have been present in each well during installation and to remove any water that may have been introduced during drilling. Following monitor well development,

groundwater samples were collected on March 12 and 13, 2013 into clean sample bottles and submitted to Maxxam Analytics in St. John's, NL and Bedford, NS for laboratory analysis of petroleum hydrocarbons (TPH and BTEX), TPH fractionation, dissolved metals, PAHs, PCBs and general chemistry.

2.3 Laboratory Analyses

The laboratory analysis of soil and groundwater samples collected during this investigation was conducted by Maxxam Analytics in St. John's, NL and Bedford, NS. Maxxam Analytics is accredited by the Standards Council of Canada (SCC) for each of the analysis methods utilized and has an in-house QA/QC program to govern sample analysis, including replicates. The laboratory analysis schedule completed for this investigation is presented in Table 2.1 (includes laboratory duplicate samples).

Table 2.1 Summary of Laboratory Work

Parameter	Sample Matrix	
	Soil	Groundwater
Petroleum Hydrocarbons (TPH/BTEX)	21	9
Fractionated Petroleum Hydrocarbons (TPH/BTEX)	3	1
Metals	24	9
PAHs	25	9
PCBs	23	9
General Chemistry	-	10
Total Oil and Grease	7	-
Leachate	4	-

Note: The methodologies utilized by Maxxam Analytics in analysis of the soil and groundwater samples are presented on the analytical reports in Appendix D.

2.4 Quality Assurance/Quality Control (QA/QC) Discussion

In order to minimize cross contamination during sampling, a field Quality Assurance/Quality Control (QA/QC) program was followed, which included the following measures:

- Disposable nitrile surgical gloves (dust free) were worn during all sampling (new gloves for each sample);
- All soil sampling equipment was thoroughly cleaned and rinsed with potable water prior to sampling to ensure that samples were unaffected by cross-contamination from previous samples;
- New laboratory-supplied jars were used to collect soil, groundwater and surface water samples;
- Each sample jar was labeled prior to sampling; and,
- Samples were stored in a cooler with ice/ice packs to keep cool during shipment to the laboratory.

In addition, the Maxxam Analytics laboratories have an extensive QC program in place to ensure that reliable results are consistently obtained. Specific laboratory QC measures include:

- Chain of Custody and sample integrity inspection;
- Strict documentation control and files;
- Trained personnel prepare and analyze samples according to Standard Operating Procedures;
- All analytical methods are based on accepted (e.g., Ontario MOE, US EPA, ASTM) procedures and are fully validated prior to use;
- Precision is monitored by performing replicate analysis of samples within each batch (dependant on batch size);
- Accuracy is verified by analyzing spiked samples and reference materials within each batch (dependant on batch size);
- Instrument calibration integrity is ensured by analyzing calibration check standards within each run sequence;
- Matrix effects in organic analyses are assessed with surrogate fortification of each sample;
- Extensive use is made of reference material for routine procedure evaluation;
- Highest available purity analytical standards;
- Predefined analytical sequences ensure all results are traceable to calibration and QC data;
- Hard copy reports displaying all of the required data are generated for each instrument;
- Analytical results are determined only from instrument responses that fall within the calibration range;
- Acceptable QC performance must be demonstrated prior to data authorization (data are subject to three levels of QC review: chemist, supervisor and manager);
- On-going method and instrument performance records are maintained for all analyses; and,
- Records containing all pertinent data are securely archived for three years.

Laboratory duplicate analyses were carried out on several samples analyzed during the current investigation. Maxxam Analytics laboratory certificates are included in Appendix D. Due to the limited amount of soil collected from the split spoon during drilling and the number of analytes carried out on the soil samples during laboratory analysis, field duplicate samples were not available to be submitted for QA/QC purposes.

3.0 RESULTS OF PHASE II ENVIRONMENTAL SITE ASSESSMENT

The following sections present the results of the Phase II ESA conducted at the site, including a description of the subsurface conditions encountered during the investigation and the characterization of the existence of soil and groundwater impacts at the site.

3.1 Subsurface Conditions

3.1.1 Stratigraphy

Conditions encountered in the monitor wells are described in detail on the Monitor Well Records in Appendix B and are based on the descriptions provided in the Geotechnical Report (Stantec, 2013) completed concurrently with the Phase II ESA.

3.1.1.1 Fill

Asphalt or reinforced concrete slab was encountered at the surface at the borehole locations. The thickness of asphalt was about 100 mm and about 250 mm, for the reinforced concrete slab. Fill materials were encountered underlying the surficial layer of asphalt or reinforced concrete slab at all borehole locations. The thickness of the fill ranged from 0.6 m in borehole BH11 to as much as 6.9 m in BH02.

Based on the geotechnical report, the fill generally can be sub-divided in two (2) layers (BH1 to BH11), an upper and lower layer. The upper layer is described as a dense to very dense, grey to brown to black, silty sand with gravel to well-graded gravel with sand and silt and contained trace amounts of cobbles. This upper fill layer was anywhere from 0.6 m to 2.5 m in thickness and was noted at all borehole locations. This upper fill layer appeared to be consistent in nature with a compacted engineered structural fill material.

The lower fill layer was generally noted to be very loose to dense, grey to black, silty sand with gravel to a poorly graded sand with gravel and silt containing a varying amount of (trace to frequent in content) of one or more of the following; wood debris, wood branches, undifferentiated organic matter, to glass debris. This lower fill layer was generally consistent in nature with material placed in an uncontrolled, non-engineered manner.

It should be noted that only the denser upper layer of fill was encountered at borehole locations BH9 to BH12.

3.1.1.2 Marine Sediments

Underlying the fill layer was a stratum of very loose to compact, brown to black, silty sand with gravel with trace to frequent amounts of organic matter consistent with a marine depositional environment. This stratum was encountered in boreholes BH1 to BH4, BH6, BH7, BH13 and BH14 and ranged in thickness from 0.13 m in borehole BH14 to as much as 3.7 m in borehole BH1.

3.1.1.3 Glacial Till

A native glacial till layer was encountered underlying the fill or marine sediment in all boreholes except in BH8 and BH10 to BH12. The till ranged in thickness from 0.3 m in borehole BH7 to 4.1 m in borehole BH2. The till was generally composed of compact to very dense, brown to grey, silty sand with gravel to poorly or well-graded gravel with silt and sand, and contained trace amounts of cobbles.

3.1.1.4 Bedrock

Bedrock was encountered in all boreholes except boreholes BH13 to BH15, where these were advanced to a predetermined depth of about 4.5 m for the installation of groundwater monitoring wells. Depth of bedrock varied from about 0.8 m in borehole BH11 to 11.6 m in borehole BH2. The bedrock is described as a greyish green to bluish grey, siltstone and sandstone sedimentary rock. The quality of the bedrock was generally very severely fractured at the bedrock surface, becoming to moderately jointed or intact with depth.

3.1.2 Groundwater Observations

The depths to groundwater in the boreholes and monitor wells, as measured between February 24, 2013 and March 12, 2013 during groundwater sampling, ranged from 0.50 mbgs in monitor well BH10 to 2.42 mbgs in monitor well BH15. Groundwater levels within these monitor wells are expected to vary seasonally and in response to individual precipitation events as well as in response to diurnal tidal fluctuations.

Based on the local topography and the measured groundwater levels, the inferred direction of local groundwater flow at the site is towards the St. John's Harbour to the northwest, as shown on Drawing No. 121412551-EE-02 in Appendix A. Groundwater depths for all monitor wells are presented in Table 3.1 and on the Monitor Well Records in Appendix B.

Table 3.1 Groundwater Depths and Elevations

Borehole I.D.	Date Measured	Groundwater Depth (mbgs)	Monitor Well Top of Casing Elevation (m)	Groundwater Elevation (m) ^a
BH1	12-Mar-13	1.64	2.06	0.42
BH2	12-Mar-13	2.30	2.08	-0.22
BH3	6-Mar-13	1.40	2.07	0.67
BH4	12-Mar-13	2.36	2.15	-0.21
BH5	12-Mar-13	1.96	2.21	0.25
BH6	12-Mar-13	2.16	2.14	-0.02
BH7	12-Mar-13	1.89	2.11	0.22
BH8	12-Mar-13	1.38	2.35	0.97
BH9	12-Mar-13	1.48	2.58	1.10
BH10	5-Mar-13	0.50	2.55	2.05
BH11	12-Mar-13	0.70	2.85	2.15
BH12	3-Mar-13	1.20	2.71	1.51
BH13	12-Mar-13	2.19	2.24	0.05
BH14	24-Feb-13	1.90	2.32	0.42
BH15	12-Mar-13	2.42	2.41	-0.01

Notes: mbgs = meters below ground surface.

a = Elevations based on reference to NAD 83 geodetic datum.

3.1.3 Soil Vapour Concentrations

The soil vapour concentrations measured in soil samples collected from the site are provided on the Monitor Well Records in Appendix B. The soil vapour concentrations measured ranged from 0.0 ppm in three (3) soil samples (*i.e.*, BH5-SS1, BH8-SS1, BH12-SS1) to 890 ppm in soil sample BH6-SS4.

Soil vapour concentrations vary with both fuel type and age, and it should be noted that the readings are intended to provide only a qualitative indication of volatile hydrocarbon levels and are not directly equivalent to soil analytical results.

3.1.4 Liquid Phase Petroleum Hydrocarbons

Free liquid phase petroleum hydrocarbons (*i.e.*, free product) were not observed on the soil or groundwater in any of the boreholes during the current investigation.

3.2 Soil Analytical Results

Results of the laboratory analyses of soil samples for TPH/BTEX, TPH/BTEX fractionation, available metals, PAHs, PCBs, total oil and grease and leachate in soil are presented in Tables C.1 to C.7, Appendix C. The corresponding analytical reports from Maxxam Analytics are presented in Appendix D.

3.2.1 Petroleum Hydrocarbons in Soil

Petroleum hydrocarbon (TPH/BTEX) analysis was conducted on twenty (20) soil samples including one (1) to two (2) soil samples collected from each of the fifteen (15) boreholes/monitor wells (*i.e.*, BH1 to BH15), plus one (1) laboratory duplicate sample of BH15-SS1. Results of the laboratory analysis for TPH/BTEX in soil are presented in Table C.1, Appendix C. Two (2) soil samples collected from the boreholes/monitor wells (*i.e.*, BH6-SS4 and BH15-SS3) and a laboratory duplicate sample of BH15-SS3 were also analyzed for TPH fractionation. TPH fractionation results are presented in Table C.2, Appendix C.

Due to possible organic content, the laboratory was requested to conduct a triple silica gel clean-up on all of the samples prior to laboratory analysis. The silica clean-up was requested to reduce interference from non-petrogenic material (*i.e.*, organics) in the samples. The clean-up procedure, however, does not remove all of the interference. Based on the presence of the organic material, some samples did not return to baseline.

TPH was detected in nineteen (19) soil samples ranging from 16 mg/kg in soil sample BH15-SS1 to 40,000 mg/kg in soil sample BH3-SS4. The laboratory analytical report indicated that petroleum hydrocarbon products impacting the soil samples resembled either weathered fuel oil, lube oil, possibly the lube oil fraction or there was no resemblance to petroleum hydrocarbons in the fuel oil and lube oil range.

Concentrations of F1 PHC were detected in twelve (12) soil samples with concentrations ranging from 3.5 mg/kg in BH13-SS5 to 1,400 mg/kg in BH3-SS4. The concentrations of

F1 PHC detected in three (3) soil samples (*i.e.*, BH3-SS4, BH6-SS4 and BH15-SS3) exceeded the applicable CCME CWS Tier I screening value of 320 mg/kg (eco soil contact and indoor air) for a commercial site with coarse grained soil and the Tier I Management Limit of 700 mg/kg for a commercial site. Two (2) samples (*i.e.*, BH3-SS4 and BH6-SS4) also exceeded the applicable CCME CWS Tier I screening value of 970 mg/kg (protection of groundwater) for a commercial site with coarse grained soil.

Concentrations of F2 PHC were detected in twelve (12) soil samples with concentrations ranging from 19 mg/kg in BH14-AS3C to 24,000 mg/kg in BH3-SS4. The detected F2 PHC concentrations in six (6) samples (*i.e.*, BH2-SS5, BH3-SS4, BH4-SS5, BH6-SS4, BH14-SS3 and BH15-SS3) exceeded the applicable CCME CWS Tier I screening values of 260 mg/kg (eco soil contact) and 380 mg/kg (protection of groundwater) for a commercial site with coarse grained soil and five (5) samples also exceeded the Tier I Management Limit of 1,000 mg/kg for a commercial site.

Concentrations of F3 PHC were detected in twenty (20) soil samples with concentrations ranging from 16 mg/kg in BH15-SS1 to 14,300 mg/kg in BH3-SS4. The detected F3 PHC concentrations in four (4) samples (*i.e.*, BH3-SS4, BH6-SS4, BH14-AS3C and BH15-SS3) exceeded the applicable CCME CWS Tier I screening value of 1,700 mg/kg for a commercial site with coarse-grained soil and one (1) sample (*i.e.*, BH3-SS4) also exceeded the Tier I Management Limit of 3,500 mg/kg for a commercial site.

Benzene was detected in seven (7) soil samples with concentrations ranging from 0.030 mg/kg in BH10-SS1 to 0.83 mg/kg in BH2-SS7. The benzene concentration in six (6) samples (*i.e.*, BH1-SS3, BH2-SS7, BH3-SS4, BH4-SS5, BH13-SS3 and BH14-SS3) exceeded the applicable CCME guideline of 0.03 mg/kg for a commercial site with coarse-grained soil.

Toluene was detected in nine (9) soil samples at concentrations ranging from 0.056 mg/kg in BH10-SS1 to 0.29 mg/kg in BH2-SS7. The toluene concentrations did not exceed the applicable CCME guideline of 0.37 mg/kg for a commercial site with coarse-grained soil.

Ethylbenzene was detected in seven (7) soil samples at concentrations ranging from 0.044 mg/kg in BH14-SS3 to 1.8 mg/kg in BH3-SS4. The ethylbenzene concentration in four (4) samples (*i.e.*, BH2-SS7, BH3-SS4, BH6-SS4 and BH15-SS3) exceeded the applicable CCME guideline of 0.082 mg/kg for a commercial site with coarse-grained soil.

Xylenes were detected in ten (10) soil samples at concentrations ranging from 0.057 mg/kg in BH13-SS5 to 4.0 mg/kg in BH6-SS4. The xylenes concentrations did not exceed the applicable CCME guideline of 11 mg/kg for a commercial site with coarse-grained soil.

3.2.2 Available Metals in Soil

Available metals analysis was conducted on twenty-one (21) soil samples including one (1) to two (2) soil samples collected from each of the fifteen (15) boreholes/monitor wells (*i.e.*, BH1 to BH15), plus two (2) laboratory duplicate samples (*i.e.*, BH2-SS5 and BH6-SS4). Results of the laboratory analysis for available metals in soil are presented in Table C.3, Appendix C.

The detected concentrations of one (1) or more metal parameters in seven (7) soil samples (*i.e.*, BH2-SS5, BH2-SS5 Lab-Dup, BH2-SS7, BH3-SS4, BH4-SS5, BH14-SS3 and BH15-SS3) exceeded the applicable CCME guidelines for soil at a commercial site.

The following exceedances of the CCME guidelines were detected:

- Arsenic (guideline of 12 mg/kg) – BH2-SS5 (19 mg/kg), BH2-SS5 Lab-Dup (20 mg/kg), BH2-SS7 (16 mg/kg), BH4-SS5 (46 mg/kg), BH14-SS3 (15 mg/kg)
- Copper (guideline of 91 mg/kg) – BH2-SS5 Lab-Dup (120 mg/kg), BH3-SS4 (280 mg/kg), BH4-SS5 (130 mg/kg)
- Lead (guideline of 260 mg/kg) – BH2-SS7 (280 mg/kg), BH3-SS4 (390 mg/kg), BH4-SS5 (2,700 mg/kg), BH14-SS3 (340 mg/kg), BH15-SS3 (850 mg/kg)
- Nickel (guideline of 50 mg/kg) – BH4-SS5 (73 mg/kg)
- Tin (guideline of 300 mg/kg) – BH4-SS5 (320 mg/kg)
- Zinc (guideline of 360 mg/kg) – BH4-SS5 (880 mg/kg)

None of the other detected levels of available metals exceeded the applicable CCME guidelines for soil at a commercial site, where such guidelines exist.

3.2.3 PAHs in Soil

PAHs analysis was conducted on twenty-one (21) soil samples including one (1) to two (2) soil samples collected from each of the fifteen (15) boreholes/monitor wells (*i.e.*, BH1 to BH15), plus three (3) laboratory duplicate samples (*i.e.*, BH1-SS3, BH5-SS4 and BH13-SS3). Results of the laboratory analysis for PAHs in soil are presented in Table C.5, Appendix C.

Various PAH parameters were detected in all of the soil samples analyzed and the detected concentrations of one (1) or more PAH parameters in four (4) soil samples (*i.e.*, BH4-SS5, BH5-SS4, BH5-SS4 Lab-Dup and BH14-SS3) exceeded the applicable CCME guidelines for soil at a commercial site.

The following exceedances of the CCME guidelines were detected:

- Fluoranthene (guideline of 9.6 mg/kg) – BH5-SS4 (12 mg/kg), BH5-SS4 Lab-Dup (44 mg/kg), BH14-SS3 (64 mg/kg)
- Naphthalene (guideline of 22 mg/kg) – BH14-SS3 (38 mg/kg)
- Phenanthrene (guideline of 50 mg/kg) – BH14-SS3 (100 mg/kg)
- Benzo[a]anthracene (guideline of 10 mg/kg) – BH5-SS4 Lab-Dup (22 mg/kg), BH14-SS3 (25 mg/kg)
- Benzo[b]fluoranthene (guideline of 10 mg/kg) – BH14-SS3 (11 mg/kg)

- Benzo(a)pyrene TPE (total potency equivalent) concentration (guideline of 5.3 mg/kg) – BH4-SS5 (9.7 mg/kg), BH5-SS4 (7.2 mg/kg), BH5-SS4 Lab-Dup (24.1 mg/kg), BH14-SS3 (23.9 mg/kg)

None of the other detected levels of PAHs exceeded the applicable CCME guidelines for soil at a commercial site, where such guidelines exist.

3.2.4 PCBs in Soil

PCBs analysis was conducted on nineteen (19) soil samples including one (1) to two (2) soil samples collected from each of the fifteen (15) boreholes/monitor wells (*i.e.*, BH1 to BH15), plus four (4) laboratory duplicate samples (*i.e.*, BH1-SS3, BH4-SS5, BH5-SS4 and BH15-SS1). Results of the laboratory analysis for PCBs in soil are presented in Table C.6, Appendix C.

Concentrations of PCBs were not detected in the soil samples analyzed.

3.2.5 Total Oil and Grease in Soil

Total oil and grease analysis was conducted on six (6) soil samples (*i.e.*, BH2-SS5, BH5-SS4, BH6-SS4, BH8-SS4, BH13-SS5 and BH15-SS3), plus one (1) laboratory duplicate sample (*i.e.*, BH8-SS3). Results of the laboratory analysis for total oil and grease in soil are presented in Table C.7, Appendix C.

Concentrations of total oil and grease were detected in all of the soil samples ranging from 480 mg/kg in BH13-SS5 to 5,200 mg/kg in BH6-SS4. There is no known federal regulatory guideline or disposal criteria for total oil and grease in soil.

3.2.6 Leachate in Soil

Leachability for petroleum hydrocarbons, lead, fluoranthene, naphthalene and phenanthrene was carried out on four (4) soil samples (*i.e.*, BH6-SS4, BH14-SS3, BH14-AS3C and BH15-SS3). Leachability for some parameters was also carried out on two (2) laboratory duplicate samples of BH14-SS3 and BH14-AS3C. Note that other leachate requests were made to the laboratory, but they could not be completed due to the lack of sample material remaining. The results are presented in Table C.7 in Appendix C, along with the applicable guidelines. The corresponding analytical report from Maxxam Analytics is presented in Appendix D.

Concentrations of F1 PHC were detected in the leachate from the tested samples ranging from 0.92 µg/L to 1.7 µg/L. A F2 PHC concentration was detected in the leachate from one (1) of the tested samples of 0.46 µg/L (0.47 µg/L in the laboratory duplicate sample). F3 PHC was not detected. Concentrations of lead were detected in the leachate from the tested samples ranging from 10 µg/L to 2,200 µg/L, but they did not exceed the regulatory guideline (*i.e.*, 5,000 µg/L). Concentrations of fluoranthene were detected in the leachate from three (3) tested samples ranging from 0.21 µg/L to 8.5 µg/L. Concentrations of naphthalene were detected in the leachate from two (2) tested samples ranging from 8.4 µg/L to 600 µg/L. Concentrations of phenanthrene were detected in the leachate from four (4) tested samples, plus a laboratory

duplicate, ranging from 0.2 µg/L to 93 µg/L. Note that there are no regulatory guidelines for petroleum hydrocarbons, lead, fluoranthene, naphthalene and phenanthrene in leachate.

3.2.7 Soil Exceedances

The current Phase II ESA identified concentrations of contaminants in soil on the site exceeding the applicable guidelines and are summarized in Table 3.2, as referenced in Section 1.5.

Table 3.2 Soil Sample Exceedances

Monitor Well	Sample No.	Parameter/Concentration (mg/kg)	Guideline (mg/kg)	Reference
BH1	BH1-SS3	Benzene = 0.16	0.03	CCME CSQGs for commercial land use
BH2	BH2-SS5	F2 PHC = 1,800	260 (eco); 380 (gw); 1,000	Table 3, CCME CWS for PHCs in soil, eco soil contact and protection of groundwater for aquatic life and management limit, commercial site
		Arsenic = 19 & 20 (Lab-Dup)	12	CCME CSQGs for commercial land use
		Copper = 120 (Lab-Dup)	91	
BH2	BH2-SS7	Benzene = 0.83	0.03	CCME CSQGs for commercial land use
		Ethylbenzene = 0.66	0.082

3.3 Groundwater Analytical Results

Results of the laboratory analyses of groundwater samples for TPH/BTEX, TPH/BTEX fractionation, dissolved metals, PAHs, PCBs and general chemistry are presented in Tables C.8

to C.13, Appendix C. The corresponding analytical reports from Maxxam Analytics are presented in Appendix D.

3.3.1 Petroleum Hydrocarbons in Groundwater

Petroleum hydrocarbon (TPH/BTEX) analysis was conducted on nine (9) groundwater samples (*i.e.*, BH1, BH2, BH4, BH5, BH7, BH8, BH11, BH13 and BH15). Results of the laboratory analysis for TPH/BTEX in groundwater are presented in Table C.8, Appendix C. Two (2) groundwater samples collected from monitor wells BH6 and BH15 were analyzed for TPH fractionation. TPH fractionation results are presented in Table C.9, Appendix C.

TPH was detected in the groundwater samples from monitor wells BH4, BH5, BH6, BH7, BH8, BH11 and BH15. The TPH concentrations ranged from 0.19 mg/L in groundwater sample BH4 to 2.8 mg/L in groundwater sample BH6. The laboratory analytical report indicated that petroleum hydrocarbon products impacting the groundwater samples resembled either gasoline, fuel oil or there was no resemblance to petroleum hydrocarbons in the fuel oil and/or lube oil range. Based on the presence of the organic material, some samples did not return to baseline.

The concentration of F1 PHC in the groundwater sample from BH6 (1.21 mg/L) exceeded the Ontario MOE guideline of 0.42 mg/L for a non-potable site within 30 m of a water body. The concentrations of F2 PHC in the groundwater samples from BH6 (1.25 mg/L), BH8 (1.2 mg/L), BH11 (0.28 mg/L) and BH15 (1.1 mg/L and 1.63 mg/L in fractionation sample) exceeded the Ontario MOE guideline of 0.15 mg/L. The concentrations of the F3 PHC in the groundwater samples from BH8 (0.63 mg/L) and BH15 (0.61 mg/L in fractionation sample) exceeded the Ontario MOE guideline of 0.15 mg/L.

Benzene was detected in three (3) groundwater samples (*i.e.*, BH4, BH6 and BH11); toluene and ethylbenzene were detected in two (2) groundwater samples (*i.e.*, BH6 and BH11); and, xylenes were detected in three (3) groundwater samples (*i.e.*, BH6, BH11 and BH15). These detected concentrations did not exceed the FIGQGs or the Ontario MOE guidelines, where applicable.

3.3.2 Dissolved Metals in Groundwater

Dissolved metals analysis was conducted on ten (10) groundwater samples (*i.e.*, BH1, BH2, BH4, BH5, BH6, BH7, BH8, BH11, BH13 and BH15). Results of the laboratory analysis for dissolved metals in groundwater are presented in Table C.10, Appendix C.

The detected concentrations of one (1) or more metal parameters in nine (9) groundwater samples (*i.e.*, BH1, BH2, BH4, BH5, BH7, BH8, BH11, BH13 and BH15) exceeded the applicable FIGQGs for marine life water use.

The following exceedances of the FIGQGs were detected:

- Barium (guideline of 500 µg/L) – BH11 (750 µg/L)
- Copper (guideline of 2.0 µg/L) – BH7 (3.6 µg/L), BH11 (2.3 µg/L)

- Mercury (guideline of 0.016 µg/L) – BH1 (0.053 µg/L), BH2 (0.05 µg/L), BH5 (0.10 µg/L), BH7 (0.022 µg/L), BH8 (0.35 µg/L), BH11 (0.041 µg/L), BH13 (0.18 µg/L), BH15 (1.3 µg/L)
- Zinc (guideline of 10 µg/L) – BH5 (10.8 µg/L), BH7 (43.6 µg/L), BH13 (23.4 µg/L)

None of the other detected concentrations of dissolved metals exceeded the applicable FIGQGs for marine life water use, where such guidelines exist.

In samples BH8 and BH15, the detected concentrations of mercury (0.35 µg/L and 1.3 µg/L, respectively) also exceeded the Ontario MOE guideline for a non-potable site with coarse grained soil for this parameter (*i.e.*, 0.29 µg/L). The detected concentrations of sodium in six (6) samples ranging from 277,000 µg/L to 1,570,000 µg/L in samples BS1, BH2, BH4, BH7, BH11 and BH13) also exceeded the Ontario MOE guideline for a non-potable site with coarse grained soil for this parameter (*i.e.*, 180,000 µg/L). None of the other detected concentrations of dissolved metals exceeded the applicable Ontario MOE guidelines for a non-potable site within 30 m of a water body, where guidelines exist.

3.3.3 PAHs in Groundwater

PAH analysis was conducted on ten (10) groundwater samples (*i.e.*, BH1, BH2, BH4, BH5, BH6, BH7, BH8, BH11, BH13 and BH15). Results of the laboratory analysis for PAHs in groundwater are presented in Table C.11, Appendix C.

The detected concentrations of naphthalene in three (3) groundwater samples (*i.e.*, BH1 at 6.8 µg/L, BH6 at 13 µg/L and BH11 at 3.6 µg/L) exceeded the applicable FIGQG for marine life water use (*i.e.*, 1.4 µg/L).

The detected concentrations of one (1) or more PAH parameters in four (4) groundwater samples (*i.e.*, BH1, BH2, BH5 and BH8) exceeded the applicable Ontario MOE guidelines for for a non-potable site within 30 m of a water body. The following exceedances of the Ontario MOE guidelines were detected:

- Anthracene (guideline of 1.0 µg/L) – BH1 (9.1 µg/L), BH5 (1.8 µg/L)
- Benzo(a)anthracene (guideline of 1.8 µg/L) – BH1 (12 µg/L), BH5 (3.4 µg/L)
- Benzo(a)pyrene (guideline of 0.81 µg/L) – BH1 (7.9 µg/L), BH5 (2.3 µg/L)
- Benzo(b)fluoranthene (guideline of 0.75 µg/L) – BH1 (5.4 µg/L), BH5 (1.6 µg/L)
- Benzo(g,h,i)perylene (guideline of 0.2 µg/L) – BH1 (3.8 µg/L), BH2 (0.34 µg/L), BH5 (1.0 µg/L), BH8 (0.33 µg/L)
- Benzo(k)fluoranthene (guideline of 0.4 µg/L) – BH1 (3.2 µg/L), BH5 (1.0 µg/L)
- Chrysene (guideline of 0.7 µg/L) – BH1 (11 µg/L), BH5 (3.3 µg/L), BH8 (0.71 µg/L)
- Dibenzo(a,h,)anthracene (guideline of 0.4 µg/L) – BH1 (0.89 µg/L)

- Indeno(1,2,3-c,d) pyrene (guideline of 0.2 µg/L) – BH1 (2.9 µg/L), BH2 (0.25 µg/L), BH5 (0.73 µg/L), BH8 (0.25 µg/L)

None of the other detected concentrations of dissolved metals exceeded the applicable Ontario MOE guidelines for a non-potable site within 30 m of a water body, where guidelines exist.

However, it was noted during the laboratory analysis that the groundwater samples contained sediment. Because sediment was present in the groundwater samples, it is possible that the PAHs concentrations were influenced by PAH impacted sediment in the groundwater, rather than PAHs in solution in the groundwater.

3.3.4 PCBs in Groundwater

PCB analysis was conducted on ten (10) groundwater samples (*i.e.*, BH1, BH2, BH4, BH5, BH6, BH7, BH8, BH11, BH13 and BH15). Results of the laboratory analysis for PCBs in groundwater are presented in Table C.12, Appendix C.

PCBs were not detected in any of the groundwater samples analyzed.

3.3.5 General Chemistry in Groundwater

General chemistry analysis was conducted on ten (10) groundwater samples (*i.e.*, BH1, BH2, BH4, BH5, BH6, BH7, BH8, BH11, BH13 and BH15), plus one (1) laboratory duplicate sample of BH1. Results of the laboratory analysis of general chemistry in groundwater are presented in Table C.13, Appendix C.

The measured pH in six (6) groundwater samples did not fall within the applicable FIGQG for marine life water use as follows:

- pH (guideline of 7.0 – 8.7) – BH2 (6.94), BH4 (6.85), BH5 (6.97), BH6 (6.91), BH8 (6.90), BH11 (8.99)

None of the other detected parameters of general chemistry exceeded the applicable FIGQGs for marine life water use, where guidelines exist.

3.3.6 Groundwater Exceedances

Table 3.3 summarizes the groundwater sample results from the current site investigation that exceed the applicable guidelines, as referenced in Section 1.5.

Table 3.3 Groundwater Sample Exceedances

3.4 Radon

Preliminary radon gas monitoring (*i.e.*, a screening survey) was carried out on March 28, 2012 from one borehole/monitor well (*i.e.*, BH6) to assess whether radon gas was present at the site. The radon gas monitoring was conducted by an environmental technician from Stantec at the monitor well location using a portable, direct-reading radon gas detector (*i.e.*, an Alpha II Radon Detector). Calibration of the radon gas detector was conducted prior to the sampling event to ensure proper function and accurate measurements.

Using a low flow air pump set at 3 L/min, a continuous air sample from a sampling port on the sealed well cap of the borehole was drawn into a sealed container containing the radon detector. The radon detector was operational for a period of four (4) hours with a sample interval time of one (1) hour.

See Table 3.4 for the results of the radon gas monitoring. Radon concentrations from the borehole/monitor well ranged from 291 becquerels per cubic metre (Bq/m³) to 837 Bq/m³, with an average over four (4) hours of 558 Bq/m³. Because subsurface soil gas vapours were measured, any predicted indoor air concentration would be expected to be much less due to dilution with ambient air; however there is no known correlation between soil gas measurements pre-construction and an indoor concentration. There is also no known federal environmental guideline for radon in soil gas or for radon in ambient air within a commercial property. As a reference, Health Canada recommends remedial measures within a residential property whenever the average annual radon concentration exceeds 200 Bq/m³ in the normal occupancy area.

Table 3.4 Radon Gas Monitoring Results

Borehole I.D.	Date Measured	Time Interval (hr)	Radon Concentration (pCi/L)	Radon Concentration (Bq/m ³) ^a
BH6	28-Mar-13	1	7.87	291
		2	13.44	497
		3	22.63	837
		4	17.05	631
		Average	15.08	558

Notes:
^a = 1 pCi/L = 37 Bq/m³ (Health Canada http://hc-sc.gc.ca/ewh-semt/radiation/radon/faq_fq-eng.php)

Based on the detected radon concentrations in short-term monitoring of soil gas, the following is recommended:

1. Follow the recommendations for radon preventative construction methods for new construction found in the Canadian National Building Code 2010 such as controlling air leakage with a sub-slab seamless vapour barrier and providing a ventilation system. These construction methods should mitigate the ingress of airborne radon from the ground. Another useful guide for construction is the United States Environmental

Protection Agency (EPA) "EPA/625/R-92/016 Radon Prevention in the Design and Construction of Schools and Other Large Buildings, 1994".

2. A long term sampling program is recommended within the building post construction to determine actual indoor air radon concentrations. Follow the guidance found in the "Health Canada Guide for Radon Measurements in Public Buildings (Schools, Hospitals, Care Facilities, Detention Centres), 2008". Health Canada recommends that the radon test performed in a home or public building be a long-term measurement. Health Canada does not recommend a test of duration less than one (1) month, a minimum of three (3) months is recommended and twelve (12) months is optimum.

4.0 CONCLUSIONS AND RECOMMENDATIONS

4.1 Conclusions

Stantec conducted a Phase II ESA at the Canadian Coast Guard Southside Base located off Southside Road in St. John's, Newfoundland and Labrador NL in conjunction with a Geotechnical Investigation. The Phase II ESA was carried out between February 20, 2013 and March 28, 2013 and included of the drilling of fifteen (15) boreholes complete with monitor wells at the site. Twelve (12) geotechnical/environmental boreholes (*i.e.*, BH1 to BH12) were placed on the eastern portion of the site at locations selected by PWGSC and provided to Stantec. On the western portion of the site, three (3) additional environmental boreholes complete as monitor wells (*i.e.*, BH13 to BH15) were installed. All sampling locations are shown on Drawing No. 121412551-EE-02, Appendix A. The results of the Phase II ESA are as follows:

1. Fill materials were encountered underlying the surficial layer of asphalt or reinforced concrete slab at all borehole locations. The thickness of the fill ranged from 0.6 m in borehole BH11 to as much as 6.9 m in BH2. Underlying the fill layer was a stratum of very loose to compact, brown to black, silty sand with gravel with trace to frequent amounts of organic matter consistent with a marine depositional environment (*i.e.*, marine sediment). This stratum was encountered in boreholes BH1 to BH4, BH6, BH7, BH13 and BH14; and ranged in thickness from 0.13 m in borehole BH14 to as much as 3.7 m in borehole BH01. A native glacial till layer was encountered underlying the fill or marine sediment in all boreholes except in BH8 and BH10 to BH12. The till ranged in thickness from 0.3 m in borehole BH7 to 4.1 m in borehole BH2. Bedrock was encountered in all boreholes except boreholes BH13 to BH15, where these were advanced to a predetermined depth of about 4.5 m for the installation of groundwater monitoring wells. Depth of bedrock varied from about 0.8 m in borehole BH11 to 11.6 m in borehole BH2.
2. The depths to groundwater in the boreholes and monitor wells, as measured between February 24, 2013 and March 12, 2013 during groundwater sampling, ranged from 0.50 mbgs in monitor well BH10 to 2.42 mbgs in monitor well BH15. Groundwater levels within these monitor wells are expected to vary seasonally and in response to individual

precipitation events and in response to individual precipitation events as well as in response to diurnal tidal fluctuations.

3. Based on the local topography and the measured groundwater levels, the inferred direction of local groundwater flow at the site is towards the St. John's Harbour to the northwest.
4. Free liquid phase petroleum hydrocarbons were not observed on soil or groundwater in any of the monitor wells.
5. Petroleum Hydrocarbons
 - a. The concentrations of F1, F2 and F3 PHC and/or BTEX detected in soil samples from boreholes BH1 to BH4 and BH6 on the eastern portion of the site and boreholes BH13 to BH15 on the western portion of the site exceeded the applicable guidelines.
 - b. The concentrations of F1, F2 and/or F3 PHC detected in groundwater samples from boreholes BH6, BH8 and BH11 on the eastern portion of the site and borehole BH15 on the western portion of the site exceeded the applicable guidelines.

6. Metals

- a. The detected concentrations of one (1) or more metal parameters in soil samples from boreholes BH2, BH3 and BH4 on the eastern portion of the site and boreholes BH14 and BH15 on the western portion of the site exceeded the applicable guidelines.
- b. The detected concentrations of one (1) or more metal parameters in groundwater samples from boreholes BH1, BH2, BH4, BH5, BH7, BH8 and BH11 on the eastern portion of the site and boreholes BH13 and BH15 on the western portion of the site exceeded the applicable guidelines.

7. PAHs

- a. The detected concentrations of one (1) or more PAH parameters in soil samples from boreholes BH4 and BH5 on the eastern portion of the site and borehole BH14 on the western portion of the site exceeded the applicable guidelines.
- b. The detected concentrations of one (1) or more PAH parameters in groundwater samples from boreholes BH1, BH2, BH5, BH6, BH8 and BH11 on the eastern portion of the site exceeded the applicable guidelines. However, it was noted during the laboratory analysis that the groundwater samples contained sediment. Because sediment was present in the groundwater samples, it is possible that the PAHs concentrations were influenced by PAH impacted sediment in the groundwater, rather than PAHs in solution in the groundwater.
8. See Drawing No. 121412551-EE-03 in Appendix A for the approximate extent of PHCs, metals and/or PAH concentrations in soil and groundwater exceeding applicable guidelines.

9. PCBs - Concentrations of PCBs were not detected in the soil or groundwater samples analyzed.
10. Total Oil and Grease - Concentrations of total oil and grease were detected in the soil samples analyzed from boreholes BH2, BH5, BH6 and BH8 on the eastern portion of the site and boreholes BH13 and BH15 on the western portion of the site.
11. Leachate in Soil - Leachability for petroleum hydrocarbons, lead, fluoranthene, naphthalene and phenanthrene was carried out on four (4) soil samples (*i.e.*, BH6-SS4, BH14-SS3, BH14-AS3C and BH15-SS3). Concentrations of lead were detected in the leachate from the tested samples, but they did not exceed the regulatory guideline (*i.e.*, 5,000 µg/L). Note that there are no regulatory guidelines for petroleum hydrocarbons, lead, fluoranthene, naphthalene and phenanthrene in leachate.
12. General Chemistry in Groundwater - The measured pH in groundwater samples from boreholes BH2, BH4, BH5, BH6, BH8 and BH11 on the eastern portion of the site was not within the applicable guideline.
13. Radon
 - a. Preliminary radon gas monitoring (*i.e.*, a screening survey) was carried out on March 28, 2012 from one borehole/monitor well (*i.e.*, BH6) to assess whether radon gas was present at the site.
 - b. Radon concentrations from the borehole/monitor well ranged from 291 Bq/m³ to 837 Bq/m³, with an average over four (4) hours of 558 Bq/m³. Because subsurface soil gas vapours were measured, any predicted indoor air concentration would be expected to be much less due to dilution with ambient air; however there is no known correlation between soil gas measurements pre-construction and an indoor concentration. There is also no known federal environmental guideline for radon in soil gas or for radon in ambient air within a commercial property. As a reference, Health Canada recommends remedial measures within a residential property whenever the average annual radon concentration exceeds 200 Bq/m³ in the normal occupancy area.

4.2 Recommendations

Based on the conclusions of the current Phase II ESA, Stantec offers the following recommendations:

1. It is possible that the PAHs concentrations in groundwater were influenced by PAH impacted sediment, rather than PAHs in solution in the groundwater. Collect additional groundwater samples from monitor wells BH1, BH2, BH5, BH6, BH8 and BH11 using a low flow pump to reduce sediment interference and submit for laboratory analysis of PAHs. Request that the laboratory decant the groundwater sample prior to analysis to further reduce sediment interference.
2. Identify any data gaps present and conduct a Human Health and Ecological Risk Assessment (HHERA) to evaluate potential risks to human and ecological receptors associated with residual chemical contamination on the subject site.

3. Identify the requirements for remediation and/or risk management based on the results of the risk assessments.
4. Any personnel engaged in construction and/or excavation on the site should be advised of the potential risks associated with dermal contact or ingestion of soil that contains contaminants of potential concern. A risk management plan (RMP) should be implemented prior to excavation activities. The RMP will outline the personal protective equipment (PPE) requirements (gloves, closed toed boots and coveralls) and will discuss the recommended actions to follow if exposed (washing with soap and water, cleaning of PPE, etc.).
5. Because petroleum hydrocarbons and metal exceedances were detected in site soil, should the property be redeveloped, any excess soil generated by the redevelopment should be tested prior to leaving the site to determine soil disposal options.
6. If site conditions or land uses change (e.g., residential usage, potable groundwater or if further development takes place on the site), the results of the on-site risk assessment may need to be revisited to ensure that there are no additional or increased risks to potential receptors, on-site or off-site.
7. It is our understanding that there is no current groundwater use for potable drinking water. The assumption is made that prior to any future use of groundwater for potable drinking water or other human use (*i.e.*, showering, washing), the groundwater will be tested to demonstrate that groundwater quality is within the Guidelines for Canadian Drinking Water Quality.
8. Based on the detected radon concentrations in short-term monitoring of soil gas on the site, the following is recommended:
 - a. Follow the recommendations for radon preventative construction methods for new construction found in the Canadian National Building Code 2010 such as controlling air leakage with a sub-slab seamless vapour barrier and providing a ventilation system. These construction methods should mitigate the ingress of airborne radon from the ground. Another useful guide for construction is the United States Environmental Protection Agency (EPA) "EPA/625/R-92/016 Radon Prevention in the Design and Construction of Schools and Other Large Buildings, 1994".
 - b. A long term sampling program is recommended within the building post construction to determine actual indoor air radon concentrations. Follow the guidance found in the "Health Canada Guide for Radon Measurements in Public Buildings (Schools, Hospitals, Care Facilities, Detention Centres), 2008". Health Canada recommends that the radon test performed in a home or public building be a long-term measurement. Health Canada does not recommend a test of duration less than one (1) month, a minimum of three (3) months is recommended and twelve (12) months is optimum.

5.0 CLOSURE

This report has been prepared for the sole benefit of Public Works and Government Services Canada on behalf of the Canadian Coast Guard, Fisheries and Oceans Canada. The report may not be used by any other person or entity without the express written consent of Stantec and Public Works and Government Services Canada.

Any use which a third party makes of this report, or any reliance on decisions made based on it, are the responsibility of such third parties. Stantec accepts no responsibility for damages, if any, suffered by any third party as a result of decisions made or actions taken based on this report.

The information and conclusions contained in this report are based upon work undertaken by trained professional and technical staff in accordance with generally accepted engineering and scientific practices current at the time the work was performed. Any site-specific information provided by other parties and used or referenced by Stantec has been assumed by Stantec to be accurate. The conclusions are based on the site conditions encountered by Stantec at the time the work was performed at the specific testing and/or sampling locations, and can only be extrapolated to an undefined limited area around these locations. The extent of the limited area depends on the soil and groundwater conditions, as well as the history of the site reflecting natural, construction and other activities. In addition, analysis has been carried out for a limited number of chemical parameters, and it should not be inferred that other chemical species are not present. Due to the nature of the investigation and the limited data available, Stantec cannot warrant against undiscovered environmental liabilities. Conclusions presented in this report should not be construed as legal advice.

APPENDIX B

Symbols and Terms

Monitor Well Records

SYMBOLS AND TERMS USED ON BOREHOLE AND TEST PIT RECORDS

SOIL DESCRIPTION

Terminology describing common soil genesis:

<i>Rootmat</i>	- Vegetation, roots and moss with organic matter and topsoil typically forming a mattress at the ground surface
<i>Topsoil</i>	- mixture of soil and humus capable of supporting vegetative growth
<i>Peat</i>	- mixture of visible and invisible fragments of decayed organic matter
<i>Till</i>	- unstratified glacial deposit which may range from clay to boulders
<i>Fill</i>	- material below the surface identified as placed by humans (excluding buried services)

Terminology describing soil structure:

<i>Homogeneous</i>	- same color and consistency throughout
<i>Desiccated</i>	- having visible signs of weathering by oxidization of clay minerals, shrinkage cracks, etc.
<i>Fissured</i>	- having cracks, and hence a blocky structure
<i>Varved</i>	- composed of regular alternating layers of silt and clay
<i>Stratified</i>	- composed of alternating successions of different soil types, e.g. silt and sand
<i>Layer</i>	- > 75 mm in thickness
<i>Seam</i>	- 2 mm to 75 mm in thickness
<i>Parting</i>	- < 2 mm in thickness

Terminology describing soil types:

The classification of soil types are made on the basis of grain size and plasticity in accordance with the Unified Soil Classification System (USCS) (ASTM D 2487 or D 2488). The classification excludes particles larger than 76 mm (3 inches). The USCS provides a group symbol (e.g. SM) and group name (e.g. silty sand) for identification.

Terminology describing cobbles, boulders, and non-matrix materials (organic matter or debris):

Terminology describing materials outside the USCS, (e.g. particles larger than 76 mm, visible organic matter, and construction debris) is based upon the proportion of these materials present:

<i>Trace, or occasional</i>	Less than 10%
<i>Some</i>	10-20%
<i>Frequent</i>	> 20%

Terminology describing compactness of cohesionless soils:

The standard terminology to describe cohesionless soils includes compactness (formerly "relative density"), as determined by the Standard Penetration Test N-Value (also known as N-Index) in accordance with ASTM D1586. A relationship between compactness condition and N-Value is shown in the following table.

Compactness Condition	SPT N-Value
<i>Very Loose</i>	<4
<i>Loose</i>	4-10
<i>Compact</i>	10-30
<i>Dense</i>	30-50
<i>Very Dense</i>	>50

Terminology describing consistency of cohesive soils:

The standard terminology to describe cohesive soils includes the consistency, which is based on undrained shear strength as measured by *in situ* vane tests, penetrometer tests, or unconfined compression tests.

Consistency	Undrained Shear Strength		Approximate SPT N-Value
	kips/sq.ft.	kPa	
<i>Very Soft</i>	<0.25	<12.5	<2
<i>Soft</i>	0.25 - 0.5	12.5 - 25	2-4
<i>Firm</i>	0.5 - 1.0	25 - 50	4-8
<i>Stiff</i>	1.0 - 2.0	50 - 100	8-15
<i>Very Stiff</i>	2.0 - 4.0	100 - 200	15-30
<i>Hard</i>	>4.0	>200	>30

ROCK DESCRIPTION

Terminology describing rock quality:

RQD	Rock Mass Quality		
0-25	Very Poor Quality	Very Severely Fractured	Crushed
25-50	Poor Quality	Severely Fractured	Shattered or Very Blocky
50-75	Fair Quality	Fractured	Blocky
75-90	Good Quality	Moderately Jointed	Sound
90-100	Excellent Quality	Intact	Very Sound

The RQD denotes the percentage of intact and sound rock retrieved from a borehole of any orientation. All pieces of intact and sound rock core equal to or greater than 100 mm (4 in.) long are summed and divided by the total length of the core run. RQD determined in accordance with ASTM D6032.

Terminology describing rock with respect to discontinuity spacing:

Spacing (mm)	Discontinuity	Bedding, Laminations, Bands
> 6000	Extremely Wide	-
2000-6000	Very Wide	Very Thick
600-2000	Wide	Thick
200-600	Moderate	Medium
60-200	Close	Thin
20-60	Very Close	Very Thin
<20	Extremely Close	Laminated
<6	-	Thinly Laminated

Terminology describing rock strength:

Strength Classification	Grade	Unconfined Compressive Strength (MPa)
Extremely Weak	R0	< 1
Very Weak	R1	1 – 5
Weak	R2	5 – 25
Medium Strong	R3	25 – 50
Strong	R4	50 – 100
Very Strong	R5	100 – 250
Extremely Strong	R6	> 250

Terminology describing rock weathering:

Term	Symbol	Description
Fresh	W1	No visible signs of rock weathering. Slight discolouration along major discontinuities
Slightly	W2	Discoloration indicates weathering of rock on discontinuity surfaces. All the rock material may be discoloured.
Moderately	W3	Less than half the rock is decomposed and/or disintegrated into soil.
Highly	W4	More than half the rock is decomposed and/or disintegrated into soil.
Completely	W5	All the rock material is decomposed and/or disintegrated into soil. The original mass structure is still largely intact.
Residual Soil	W6	All the rock converted to soil. Structure and fabric destroyed.

Solid Core Recovery (SCR):

Solid core recovery is defined as the cumulative length of all solid core in the core barrel divided by the length drilled and is recorded as a percentage on a per run basis (i.e. length of core run excluding broken, crushed or rubble zones)

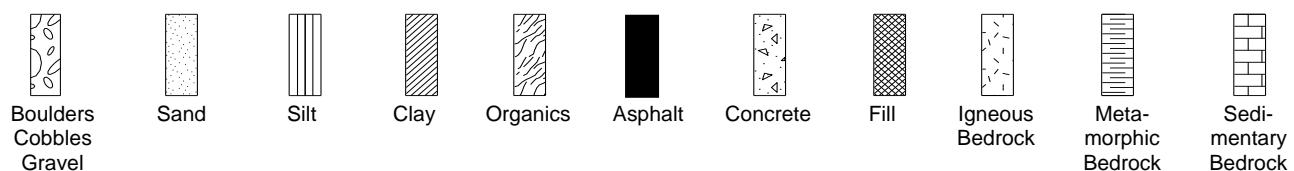

Fracture Index (FI):

Fracture Index is defined as the number of naturally occurring fractures occurring per given length of core. The Fracture Index is reported as a simple count of fractures.

STRATA PLOT

Strata plots symbolize the soil or bedrock description. They are combinations of the following basic symbols. The dimensions within the strata symbols are not indicative of the particle size, layer thickness, etc.

SAMPLE TYPE

SS	Split spoon sample (obtained by performing the Standard Penetration Test)
ST	Shelby tube or thin wall tube
DP	Direct-Push sample (small diameter tube sampler hydraulically advanced)
PS	Piston sample
BS	Bulk sample
HQ, NQ, BQ, etc.	Core samples obtained with the use of standard size diamond coring bits.

RECOVERY

For soil samples, the recovery is recorded as the length of the soil sample recovered. For rock core, recovery (or total core recovery - TCR) is defined as the total cumulative length of all core recovered in the core barrel divided by the length drilled and is recorded as a percentage on a per run basis.

N-VALUE

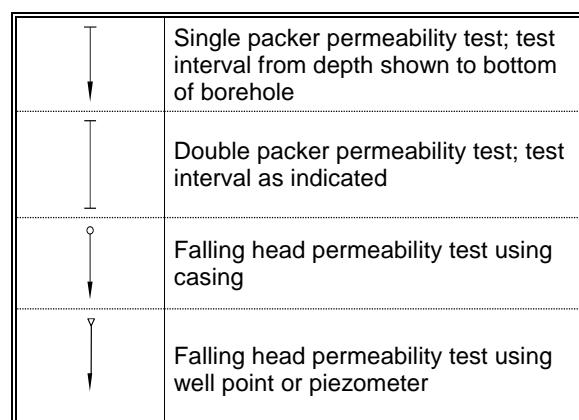

Numbers in this column are the field results of the Standard Penetration Test: the number of blows of a 140 pound (64 kg) hammer falling 30 inches (762 mm), required to drive a 2 inch (50.8 mm) O.D. split spoon sampler one foot (305 mm) into the soil. In accordance with ASTM D1586, the N-value equals the sum of the number of blows (N) required to drive the sampler over the interval of 6 to 18 in. (152 to 457 mm). However, the number of blows (N) required to drive the sampler over the interval of 12 to 24 in. (305 to 610 mm) may be reported if this value is lower. For split spoon samples where insufficient penetration was achieved and N-values cannot be presented, the total number of blows are reported over sampler penetration in millimeters (e.g., 50/75).

DYNAMIC CONE PENETRATION TEST (DCPT)

Dynamic cone penetration tests are performed using a standard 60 degree apex cone connected to A size drill rods with the same standard fall height and weight as the Standard Penetration Test. The DCPT value is the number of blows of the hammer required to drive the cone one foot (305 mm) into the soil. The DCPT is used as a probe to assess soil variability.

OTHER TESTS

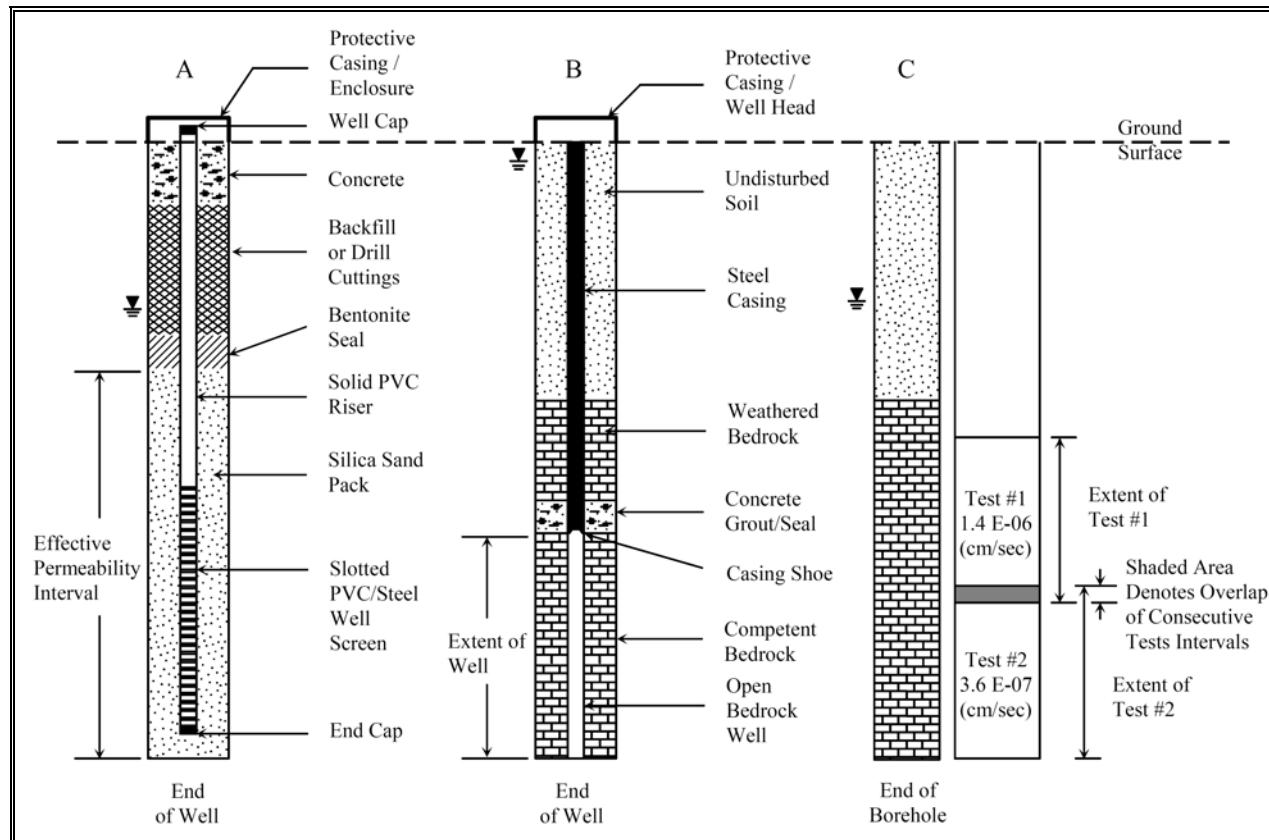

S	Sieve analysis
H	Hydrometer analysis
k	Laboratory permeability
γ	Unit weight
G_s	Specific gravity of soil particles
CD	Consolidated drained triaxial
CU	Consolidated undrained triaxial with pore pressure measurements
UU	Unconsolidated undrained triaxial
DS	Direct Shear
C	Consolidation
Q_u	Unconfined compression
I_p	Point Load Index (I_p on Borehole Record equals $I_p(50)$ in which the index is corrected to a reference diameter of 50 mm)

SYMBOLS AND TERMS USED ON MONITOR WELL, WATER WELL AND ENVIRONMENTAL RECORDS

Well Construction and Permeability Testing

Basic symbols used in typical monitor or water well and piezometer construction are shown below. The well construction symbols or materials shown below may be combined or altered to suit a particular application. The diagram shows: A) a typical piezometer or monitor well in overburden; B) a typical water well in bedrock; C) borehole permeability test results in bedrock.

Apparent Moisture Content

Terminology used to describe apparent moisture content at the time of borehole drilling or test pit excavation.

Symbol	Description
D	Dry – containing little or no moisture
M	Moist – containing some moisture without having ‘free’ moisture
S	Saturated – ‘free’ moisture can drain from material

Terminology Describing Contamination

Symbol	Description
PID	Photo Ionization Detector (readings in ppm)
TPH	Total Petroleum Hydrocarbon concentration (readings in ppm based on mass)
ppm	Parts Per Million (measurement of concentration, mg/kg or mg/L)
nd	Not Detected – below limit of quantification (LOQ)

Apparent Hydrocarbon Odour

Terminology used to describe apparent hydrocarbon odour at the time of borehole drilling or test pit excavation.

Value	Description
0	No apparent odour
1	Slight odour
2	Moderate odour
3	Strong odour

Notes:

1 = CCME CSQG = Canadian Council of Ministers of the Environment (CCME) Canadian Soil Quality Guidelines (CSQGs) for the Protection of Environmental and Human Health for BTEX (CSQG on-line 2013) - Commercial Site, coarse-grained soil

2 = CCME CWS PHC = CCME Canada Wide Standards (CWS) for Petroleum Hydrocarbons (PHC) in Soil (January 2008) - Commercial Site (eco soil contact, vapour inhalation (indoor) and protection of groundwater for aquatic life) (Table 3)

3 = CCME CWS PHC Management Limit for a Commercial Site (January 2008)

4 = Modified TPH = total petroleum hydrocarbons excluding BTEX

5 = Atlantic PIRI analytical method does not analyse for >C32. Laboratory certificate indicates (Yes or No) whether chromatogram for each sample returns to baseline after C32. Samples are considered to have returned to baseline if the area from C32-C36 is less than 10% of the area from C10-C32.

* = Baseline not reached at C32; sample may contain carbon fractions >C32

Triple silica gel clean-up was used by the laboratory to remove organic interferences from sample extracts.

RDL = Reportable Detection Limit for routine analysis; nd = Not detected above standard RDL; na = Not applicable

FO = Fuel Oil; WFO = weathered fuel oil; LO = Lube Oil; PLO = Possible Lube Oil; NR = no resemblance to petroleum hydrocarbons

mbgs = metres below ground surface

Bold/Shaded = Value exceeds CCME and/or CWS eco/indoor guideline

Italics = Value exceeds CWS gw guideline

Underlined = Value exceeds CWS Management Limit

Notes:

1 = Canadian Council of Ministers of the Environment (CCME) Soil Quality Guidelines for the Protection of Environmental and Human Health (CSQG on-line 2013). As per CCME recommendations, soil samples are compared against the soil quality guidelines for the protection of human health and environmental health separately. Commercial land use.

2 = Human Health Criteria for non-carcinogenic PAHs in soil. Guidelines from other jurisdictions applied in the absence of applicable CCME guidelines. Source guideline for specific PAH parameter:^{*}Ontario Ministry of the Environment (MOE) Soil, Groundwater and Sediment Standards for Use Under Part XV.I of the Environmental Protection Act April 15, 2011. Soil Components for Table 3 – Full Depth, Non-potable Scenario (lowest applicable human health guideline); ^{**}Texas Risk Reduction Program (TRRP) Tier I protective concentration level (PCL), Table 5 (June 2012).

3 = Carcinogenic PAHs assessed as B[a]P TPE for Human Health

4 = Guideline if potential impact to surface water (freshwater)

5 = Based on CCME guidelines for ingestion, inhalation and dermal exposures. Where a parameter is not detected, 1/2 of the RDL is used in the TPE calculation.

B[a]P TPE = Benzo(a)pyrene Total Potency Equivalent concentration. Calculation assumes that soil is not contaminated with coal tar or creosote timbers

B(a)P PEF = Benzo(a)pyrene Potency Equivalent Factor

TPE = Total potency equivalent

RDL = Reportable Detection Limit for routine analysis

nd = not detected above standard RDL

" - " = no guideline available

mbgs = metres below ground surface

Bold/Shaded = Value exceeds applicable guideline

Lab-Dup = Laboratory QA/QC duplicate sample

CERTIFICATE OF ANALYSIS

MAXXAM JOB #: B328518

Received: 2013/02/26, 10:23

Sample Matrix: Soil

Samples Received: 2

Analyses	Quantity	Date Extracted	Date Analyzed	Laboratory Method	Method Reference
TEH in Soil (PIRI) (1,3)	2	2013/03/05	2013/03/06	ATL SOP-00197	Based on Atl. PIRI
Metals Solids Acid Extr. ICPMS (2)	2	2013/02/28	2013/02/28	ATL SOP 00059	Based on EPA6020A
Moisture (2)	2	N/A	2013/02/27	ATL SOP 00001	MOE Handbook 1983
PAH Compounds by GCMS (SIM) (2,3)	1	2013/02/28	2013/02/28	ATL SOP 00102	Based on EPA8270C
PAH Compounds by GCMS (SIM) (2,3)	1	2013/02/28	2013/03/01	ATL SOP 00102	Based on EPA8270C
PCBs in soil by GC/ECD (2,3)	2	2013/02/28	2013/03/01	ATL SOP 00106	Based on EPA8082
VPH in Soil (PIRI) (2)	2	2013/02/27	2013/02/28	ATL SOP 00119	Based on Atl. PIRI
Total Oil and Grease - Soil (2)	2	2013/02/28	2013/03/01	ATL SOP 00100	Based on EPA9071B
ModTPH (T1) Calc. for Soil (2)	2	2013/02/27	2013/03/06		Based on Atl. PIRI

Remarks:

Reporting results to two significant figures at the RDL is to permit statistical evaluation and is not intended to be an indication of analytical precision.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) Reported on a dry weight basis.

(2) This test was performed by Bedford

(3) Soils are reported on a dry weight basis unless otherwise specified.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spiked amount was not sufficiently significant to permit a reliable recovery calculation.

NC (RPD): The RPD was not calculated. The level of analyte detected in the parent sample and its duplicate was not sufficiently significant to permit a reliable calculation.

(1) Elevated PAH RDL(s) due to sample dilution.

(2) Duplicate: results are outside acceptance limit. Insufficient sample for repeat analysis.

PAH Compounds by GCMS (SIM) (2)	2	2013/03/04	2013/03/04	ATL SOP 00102	Based on EPA8270C
PCBs in soil by GC/ECD (2)	1	2013/03/04	2013/03/06	ATL SOP 00106	Based on EPA8082
VPH in Soil (PIRI)	1	2013/03/01	2013/03/04	ATL SOP 00119	Based on Atl. PIRI
Total Oil and Grease - Soil	1	2013/03/05	2013/03/07	ATL SOP 00100	Based on EPA9071B
ModTPH (T1) Calc. for Soil	1	2013/03/01	2013/03/07		Based on Atl. PIRI

Remarks:

Reporting results to two significant figures at the RDL is to permit statistical evaluation and is not intended to be an indication of analytical precision.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) Reported on a dry weight basis.

(2) Soils are reported on a dry weight basis unless otherwise specified.

Package 1	10.9°C
-----------	--------

Each temperature is the average of up to three cooler temperatures taken at receipt

GENERAL COMMENTS

Insufficient sample to complete PCB analysis

Report re-issued to include Hg as requested on the chain of custody - 2013/03/12

Results relate only to the items tested.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spiked amount was not sufficiently significant to permit a reliable recovery calculation.

NC (RPD): The RPD was not calculated. The level of analyte detected in the parent sample and its duplicate was not sufficiently significant to permit a reliable calculation.

(1) Elevated recovery due to sample matrix. < 10 % of compounds in multi-component analysis in violation.

Remarks:

Reporting results to two significant figures at the RDL is to permit statistical evaluation and is not intended to be an indication of analytical precision.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by Bedford

(2) Reported on a dry weight basis.

(3) Soils are reported on a dry weight basis unless otherwise specified.

 QC Batch = Quality Control Batch

Maxxam Job #: B331283

Report Date: 2013/04/04

Stantec Consulting Ltd.

Site Location: R.053663.004 SOUTHSIDE CCG BASE

Your P.O. #: CALLUP#49

Package 1	8.4°C
-----------	-------

Each temperature is the average of up to three cooler temperatures taken at receipt

GENERAL COMMENTS

Revised report: TCLP Leachate + TEH, Lead, fluoranthene, naphthalene, and phenanthrene added to samples BH6-SS4, BH15-SS3, BH14-SS3, and BH14-AS3C as per client request March 22, 2013 MHL.

Results relate only to the items tested.

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Leachate Blank: A blank matrix containing all reagents used in the leaching procedure. Used to determine any process contamination.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Maxxam Job Number: ZB331283

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spiked amount was not sufficiently significant to permit a reliable recovery calculation.

NC (RPD): The RPD was not calculated. The level of analyte detected in the parent sample and its duplicate was not sufficiently significant to permit a reliable calculation.

- (1) Elevated VPH RDL(s) due to detected levels in the blank.
- (2) Elevated recovery due to sample matrix. < 10 % of compounds in multi-component analysis in violation.
- (3) Low level lab contamination. Minimal impact on data quality.
- (4) Matrix Spike: < 10 % of compounds in multi-component analysis in violation

Remarks:

Reporting results to two significant figures at the RDL is to permit statistical evaluation and is not intended to be an indication of analytical precision.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) Reported on a dry weight basis.

(2) This test was performed by Bedford

(3) Soils are reported on a dry weight basis unless otherwise specified.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Quality Assurance Report (Continued)

Maxxam Job Number: ZB332892

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.
Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.
NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spiked amount was not sufficiently significant to permit a reliable recovery calculation.
NC (RPD): The RPD was not calculated. The level of analyte detected in the parent sample and its duplicate was not sufficiently significant to permit a reliable calculation.
(1) Poor RPD due to sample inhomogeneity.

ModTPH (T1) Calc. for Soil	4	2013/03/08	2013/03/13		Based on Atl. PIRI

Remarks:

Reporting results to two significant figures at the RDL is to permit statistical evaluation and is not intended to be an indication of analytical precision.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

- (1) Reported on a dry weight basis.
- (2) This test was performed by Bedford
- (3) Soils are reported on a dry weight basis unless otherwise specified.

POLYCHLORINATED BIPHENYLS BY GC-ECD (SOIL)

Maxxam ID		QU2443	QU2443	QU2495	QU2496	QU2497		
Sampling Date		2013/03/04	2013/03/04	2013/03/04	2013/03/05	2013/03/03		
COC Number		ES685713	ES685713	ES685713	ES685713	ES685713		
	Units	BH1 - SS3	BH1 - SS3 Lab-Dup	BH1 - SS9	BH10 - SS1	BH12 - SS2	RDL	QC Batch

PCBs								
Total PCB	ug/g	ND	ND	ND	ND	ND	0.050	3151998
Surrogate Recovery (%)								
Decachlorobiphenyl	%	81	80	80	78	77 (1)		3151998

ND = Not detected

RDL = Reportable Detection Limit

QC Batch = Quality Control Batch

(1) PCB:Unidentified (possibly halogenated) compounds detected.

Maxxam Job #: B334900
Report Date: 2013/03/18

Your P.O. #: CALL UP #49
Sampler Initials: DM

SEMI-VOLATILE ORGANICS BY GC-MS (SOIL)

PAH Compounds by GCMS (SIM): Elevated PAH RDL(s) due to matrix / co-extractive interference.

Results relate only to the items tested.

	Spiked Blank	Decachlorobiphenyl	2013/03/18	87	%	30 - 130	
		Total PCB	2013/03/18	120	%	70 - 130	
	Method Blank	Decachlorobiphenyl	2013/03/18	84	%	30 - 130	
		Total PCB	2013/03/18	ND, RDL=0.050	ug/g		
	RPD [QU2443-02]	Total PCB	2013/03/18	NC	%		50

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spiked amount was not sufficiently significant to permit a reliable recovery calculation.

NC (RPD): The RPD was not calculated. The level of analyte detected in the parent sample and its duplicate was not sufficiently significant to permit a reliable calculation.

(1) Elevated PAH RDL(s) due to matrix / co-extractive interference.

Remarks:

Reporting results to two significant figures at the RDL is to permit statistical evaluation and is not intended to be an indication of analytical precision.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

- (1) Reported on a dry weight basis.
(2) This test was performed by Bedford
(3) Soils are reported on a dry weight basis unless otherwise specified.

		Total PCB	2013/03/18	NC	%	50	

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spiked amount was not sufficiently significant to permit a reliable recovery calculation.

NC (RPD): The RPD was not calculated. The level of analyte detected in the parent sample and its duplicate was not sufficiently significant to permit a reliable calculation.

(1) Elevated PAH RDL(s) due to matrix / co-extractive interference.

CERTIFICATE OF ANALYSIS

MAXXAM JOB #: B336834

Received: 2013/03/12, 16:07

Sample Matrix: Water

Samples Received: 8

Analyses	Quantity	Date Extracted	Date Analyzed	Laboratory Method	Method Reference
TEH in Water (PIRI)	8	2013/03/13	2013/03/15	ATL SOP 00198	Based on Atl. PIRI
VPH in Water (PIRI)	8	2013/03/13	2013/03/14	ATL SOP 00200	Based on Atl. PIRI
ModTPH (T1) Calc. for Water	8	N/A	2013/03/15		Based on Atl. PIRI

Remarks:

Reporting results to two significant figures at the RDL is to permit statistical evaluation and is not intended to be an indication of analytical precision.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (RPD): The RPD was not calculated. The level of analyte detected in the parent sample and its duplicate was not sufficiently significant to permit a reliable calculation.

(1) Fuel/lube oil range recovery(ies) not within acceptance limits. Insufficient sample to repeat.

(2) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

Package 1	9.2°C
-----------	-------

Each temperature is the average of up to three cooler temperatures taken at receipt

GENERAL COMMENTS

- Sample QV7550-01: Poor RCap Ion Balance due to sample matrix. Possibly due to fine particulate matter.
- Sample QV7552-01: Poor RCap Ion Balance due to sample matrix. Possibly due to fine particulate matter.
- Sample QV7556-01: Poor RCap Ion Balance due to sample matrix. Possibly due to fine particulate matter.
- Sample QV7557-01: Poor RCap Ion Balance due to sample matrix. Possibly due to fine particulate matter.

Results relate only to the items tested.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

QC Standard: A sample of known concentration prepared by an external agency under stringent conditions. Used as an independent check of method accuracy.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spiked amount was not sufficiently significant to permit a reliable recovery calculation.

NC (RPD): The RPD was not calculated. The level of analyte detected in the parent sample and its duplicate was not sufficiently significant to permit a reliable calculation.

CERTIFICATE OF ANALYSIS

MAXXAM JOB #: B338124

Received: 2013/03/14, 09:39

Sample Matrix: Water

Samples Received: 1

Analyses	Quantity	Date Extracted	Date Analyzed	Laboratory Method	Method Reference
Carbonate, Bicarbonate and Hydroxide (1)	1	N/A	2013/03/19	CAM SOP-00102	APHA 4500-CO2 D
Alkalinity (1)	1	N/A	2013/03/21	ATL SOP 00013	Based on EPA310.2
Chloride (1)	1	N/A	2013/03/18	ATL SOP 00014	Based on SM4500-Cl
Colour (1)	1	N/A	2013/03/19	ATL SOP 00020	Based on SM2120C
Conductance - water (1)	1	N/A	2013/03/18	ATL SOP-00004	Based on SM2510B
TEH in Water (AA PIRI) (1)	1	2013/03/18	2013/04/02	ATL SOP 00116	Based on Atl. PIRI
Hardness (calculated as CaCO ₃) (1)	1	N/A	2013/03/20	ATL SOP 00048	Based on SM2340B
Mercury - Total (CVAA,LL) (1)	1	2013/03/19	2013/03/12	ATL SOP 00026	Based on EPA245.1
Metals Water Diss. MS (1,2)	1	N/A	2013/03/19	ATL SOP 00059	Based on EPA6020A
Ion Balance (% Difference) (1)	1	N/A	2013/03/22		
Anion and Cation Sum (1)	1	N/A	2013/03/20		
Nitrogen Ammonia - water (1)	1	N/A	2013/03/19	ATL SOP 00015	Based on USEPA 350.1
Nitrogen - Nitrate + Nitrite (1)	1	N/A	2013/03/20	ATL SOP 00016	Based on USGS - Enz.
Nitrogen - Nitrite (1)	1	N/A	2013/03/18	ATL SOP 00017	Based on SM4500-NO2B
Nitrogen - Nitrate (as N) (1)	1	N/A	2013/03/20	ATL SOP 00018	Based on ASTM D3867
PAH in Water by GC/MS (SIM) (1)	1	2013/03/15	2013/03/16	ATL SOP 00103	Based on EPA 8270C
PCBs in water by GC/ECD (1)	1	2013/03/18	2013/03/20	ATL SOP 00107	Based on EPA8082
pH (1)	1	N/A	2013/03/18	ATL SOP 00003	Based on SM4500-H+B
Phosphorus - ortho (1)	1	N/A	2013/03/21	ATL SOP 00021	Based on USEPA 365.2
VPH in Water (PIRI2) (1)	1	2013/03/21	2013/03/21	ATL SOP 00120	Based on Atl. PIRI
Sat. pH and Langelier Index (@ 20C) (1)	1	N/A	2013/03/22	ATL SOP-00049	.
Sat. pH and Langelier Index (@ 4C) (1)	1	N/A	2013/03/22	ATL SOP-00049	.
Reactive Silica (1)	1	N/A	2013/03/19	ATL SOP 00022	Based on EPA 366.0
Sulphate (1)	1	N/A	2013/03/19	ATL SOP 00023	Based on EPA 375.4
Total Dissolved Solids (TDS calc) (1)	1	N/A	2013/03/22		
Organic carbon - Total (TOC) (1)	1	N/A	2013/03/19	ATL SOP 00037	Based on SM5310C
ModTPH (T2) Calc. for Water (1)	1	N/A	2013/04/03		Based on Atl. PIRI
Turbidity (1)	1	N/A	2013/03/18	ATL SOP 00011	based on EPA 180.1

Remarks:

Reporting results to two significant figures at the RDL is to permit statistical evaluation and is not intended to be an indication of analytical precision.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

QC Standard: A sample of known concentration prepared by an external agency under stringent conditions. Used as an independent check of method accuracy.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spiked amount was not sufficiently significant to permit a reliable recovery calculation.

NC (RPD): The RPD was not calculated. The level of analyte detected in the parent sample and its duplicate was not sufficiently significant to permit a reliable calculation.

(1) PAH sample contained sediment.

(2) Matrix Spike: results are outside acceptance limit. Insufficient sample for repeat analysis.

(3) Elevated PAH RDL(s) due to matrix / co-extractive interference.

(4) Elevated TEH RDL(s) due to matrix interference. Elevated TEH RDL(s) due to limited sample.

(5) Elevated reporting limit due to sample matrix.
