

Solicitation No. EQ447-181210/A

Project No. R.090007.001 Niagara River Light Station – Lead Based Paint Abatement

Questions and Answers:

Question 1: The proposed gel abatement method will be affected by colder temperatures. With a multiple layer removal, and cold temperatures, the proposed deadline in the specifications may not be achieved. Would PWGSC be willing to accept an alternative method for the abatement scope? This was brought up at the site meeting. A fully enclosed, chambered, sandblasting method of abatement would be proposed. This is a more aggressive method; however, the time to complete the set-up, abatement and tear down would comply with the timelines set out in the specifications. Also, with this alternate method, the workers will be on supplied air inside the enclosure, not visible to the public.

Response 1: See addendum to the specification.
