

Derrick Trunion Bearing and Heal Pin

*PATROL NOTES - Senior Engineer.
Oct 26 -- Nov 23, 2004*

Intercon Marine is contracted to remove the trunion from its mounting flange on top of the wire led room. To do this they will brace the boom and remove the heel pin. This has been done, and the trunion was moved to covered storage where it was disassembled to display the tapered roller bearings for ship safety inspection. The bearings were in good condition and the unit has been re-assembled and lifted back into position. The trunion will be re-mounted and re-connected to the boom. A small deck crew from red cycle will be onboard the 25th of November to re-assemble the derrick's rigging. A main engine will be required for this operation.
