

Questions and Answers:

1. How has the groundwater sampling previously been completed? Are samples collected directly from watera tubing into laboratory bottles (with field filtering as necessary for metals)?

Yes. This is the method previously used.

2. What are the requirements for the collection of the field measurements (dissolved oxygen, temperature, pH, conductivity, and redox)? How have these field measurements been collected previously? Is there a requirement to show that the parameters have stabilized? Or is just one reading from the groundwater required?

There is no prescribed method for how this is collected. A reasonable amount of time should be given for parameters to stabilize before a reading is taken however there is no requirement to show that they have stabilized.
