This Amendment 002 is raised to answer bidders' question:

Q6: This requirement indicates that the primer must be lead free. It also indicates that the primer must be staked during assembly into the primer pocket. This causes a concern from a manufacturing standpoint, as lead free primers are generally more sensitive than conventional primers. This poses a serious safety concern, particularly for a round to be used exclusively for training purposes. Would the government consider either waiving the staking requirement for the lead free primer OR waiving the requirement for a lead free primer and maintaining the staking requirement?

A6: No, the staking of the primer and primer type are to be as specified as per the Request for Proposal. The primer staking requirements have been universally applied to all 9mm products (use of a known standard). We are not aware of any concerns related to the type of primer used and the staking process itself. In most cases an annular primer crimp/stake is used following primer seating.

Q7: This requirement indicates that the cartridge must be sealed for the purpose of withstanding an evacuated pressure of 50 KPa below atmospheric pressure for a minimum of 30 seconds, as articulated in the NATO MOPI test requirements for waterproofness. We are confident that our ammunition would meet this requirement without the need for applying sealant to either the primer or projectile. Would the government please consider accepting non-sealed ammunition that meets this requirement without the additional incurred cost of applying sealant?

A7: No, the sealing of the ammunition must be as specified in the Request for Proposal. Note: We are not aware of any ammunition that can pass a NATO waterproofness test without the use of some form of sealant. The sealing of the actual product improves on shelf life and reliability under various storage conditions this training ammunition will be exposed to.

All other Terms and Conditions remain the same.
