Amendment 003 has been raised to publish all answers to questions received to-date.

QUESTIONS AND ANSWERS

- Q4.** Reference to Annex A, point 4.3: "The system must have a leak rate of less than 30 millitorr per hour." and point 4.4: "The system must pump down to less than 100 millitorr in 30 minutes as measured with an empty chamber."
- These two parameters are not usually tested and manufactured by manufacturers and at this stage they can only provide some estimations (other than some specific manufacturer that has tested their unit before).
- According to manufacturer's experience, the usual running vacuum level will be 0.05mbar (37.5 millitorr) to 0.02mbar (15 millitorr).
- In the other hand, in archaeological applications, the product may be in process for weeks/months. If the vacuum pump down is 40minutes it will not make much difference.
- In order to have a more competitive opportunity, we would like to ask to remove these two requirements from the RFP.
- A4.** Canada has reviewed your question and the requirement remains unchanged. The specifications have been developed after careful review of the Canadian Conservation Institute's (CCI) needs and procedures to meet CCI's operational requirements.
- Q5.** We also wanted to ask for a week of extension to the current closing date of the RFP.
- A5.** As per amendment 002, Canada has agreed to extend the RFP as requested in order to allow time to review your question.

**ALL OTHER TERMS AND CONDITIONS OF THE REQUEST
FOR PROPOSAL REMAIN UNCHANGED.**
